## EDITOR'S NOTE

Based on the limited feedback received for the new ATCR format introduced in 2003, very few changes have been made for 2004. PDF versions of each storm page are still available on each storm page, however, a full PDF version will be created once the entire ATCR is complete and posted for those needing a document with page numbers. You can download Adobe Acrobat Reader, free of charge, from the Adobe website.

To use the ATCR, expanding menus indicated by plus (+) and minus (-) signs in the frame on the left side of the screen permit easy navigation. Simply click any (+) sign to open a menu another level.

Feedback is much appreciated and significant feedback may help shape this product in future years. You can email the editor, using this link. Editor ATCR

Special thanks to SSgt Menebroker, who provided many of the storm images used for the storms and AC1 Zopolos for the storm track graphics.

LT Y. O. Pitts, USN
Editor, 2004 ATCR

## 1. SUMMARY OF WESTERN NORTH PACIFIC AND NORTH INDIAN OCEAN TROPICAL CYCLONES

### 1.1 WESTERN NORTH PACIFIC OCEAN TROPICAL CYCLONES

Tropical cyclone genesis regions compared to the 15-year average are shown in Figure 1-1. This year's tropical cyclones are listed in Table 1-1. Table 1-2 shows the monthly distribution of tropical cyclones for each year since 1959 and Table 1-3 shows the monthly average occurrence of tropical storms separated into: (1) typhoons only; and (2) tropical storms and typhoons. A summary of this year's Tropical Cyclone Formation Alerts is shown in Table 1-4. The annual number of tropical cyclones of tropical storm strength and higher appear in Figure 1-2, while the number of super typhoons are shown in Figure 1-3. Composites of the tropical cyclone best tracks for the western North Pacific appear following Figure 1-3.

Figure 1-1. Comparison of the number of tropical cyclones that developed within 3 designated areas for 2001 through 2004 and the 10-year average.

|  | The criteria used in TABLE 12 are as follows: |  |  |  |  |  |  |  |  |  |  |  |  |
| 1) If a tropical cyclone was first warned on during the last two days of a particular month and continued into the next month for longer than two days, then that system was attributed to the second month. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 2) If a tropical cyclone was warned on prior to the last two days of a month, it was attributed to the first month, regardless of how long the system lasted. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 3) If a tropical cyclone began on the last day of the month and ended on the first day of the next month, that system was attributed to the first month. However, if a tropical cyclone began on the last day of the month and continued into the next month for only two days, then it was attributed to the second month. |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 1.2 NORTH INDIAN OCEAN TROPICAL CYCLONES

Tropical cyclone genesis regions are compared to the overall 10-year average in Figure 15.This year's North Indian Ocean tropical cyclones are listed in Table 1-5. The monthly distribution of tropical cyclones for each year since 1975 is shown in Table 1-6. Composites of the tropical cyclone best tracks for the Northern Indian Ocean appear following Table 1-6.

Figure 1-5. Comparison of the number of tropical cyclones that developed in Bay of Bengal and Arabian Sea for 2000 through 2004 and the $\mathbf{2 5}$-year average.

The criteria used in TABLE 1-6 are as follows:

1) If a tropical cyclone was first warned on during the last two days of a particular month and continued into the next month for longer than two days, then that system was attributed to the second month.
2) If a tropical cyclone was warned on prior to the last two days of a month, it was attributed to the first month, regardless of how long the system lasted.
3) If a tropical cyclone began on the last day of the month and ended on the first day of the next month, that system was attributed to the first month. However, if a tropical cyclone began on the last day of the month and continued into the next month for only two days, then it was attributed to the second month.

NORTH INDIAN OCEAN TROPICAL CYCLONES 04 MAY 04-03 DEC 04

## Tropical Storm (TS) 01W

First Poor : 2000Z 09 Feb 04
First Fair : 1300Z 11 Feb 04
First TCFA : 1500Z 11Feb 04
First Warning : 1800Z 11 Feb 04
Last Warning : 0600Z 16 Feb 04, Dissipated over water
Max Intensity : 40 kts, gusts to 50 kts
Landfall : None
Total Warnings : 19
Remarks:

1) Tropical Storm (TS) 01W formed approximately 230 nm west of Chuuk and initially tracked northwestward along the southwest periphery of the subtropical ridge. The cyclone then began to slow and loop 300 nm northnorthwest of Yap while attaining peak intensity of 40 kts on 13 Feb. The primary steering regime then shifted to the ridge centered over the Philippines and the cyclone began tracking southwest late on 15 Feb while accelerating. TS 01 W then became vertically sheared and began dissipating approximately 200 nm north of Palau on 16 Feb.
2) No damage reports were received for this system.

## TROPICAL STORM 01W

## 10-19 FEB 2004

Fix Time Intensity for 01W

## Tropical Storm (TS) 02W

First Poor : 1130Z 14 Mar 04
First Fair : 1400Z 14 Mar 04
First TCFA : 0900Z 16 Mar 04
First Warning : 1200Z 16 Mar 04
Last Warning : 0600Z 22 Mar 04, Dissipated over water
Max Intensity : 45 kts, gusts to 55 kts
Landfall : None
Total Warnings : 24
Remarks:

1) Tropical Storm (TS) 02W formed approximately 460 nm southeast of the island of Yap and initially moved northwestward towards a weakness in the subropical ridge. As the weakness developed, TS 02W began moving more poleward in the Philippine Sea east of Luzon while reaching maximum intensity of 45 kts . The cyclone then transitioned to a more northeastward track as it crested the subtropical ridge and began to encounter high vertical shear produced by the mid-latitude westerlies. The deep convection then became decoupled and the fully exposed low level circulation center drifted off to the northeast and dissipated.
2) No damage reports were received for this cyclone.

Figure 1-02W-1. 202227Z March 2004 Multi-Sensor satellite images of TS 02W, Low-Level circulation center is partially exposed to the west of deep convection and located just East of the Phillipine coastline with a peak intensity of 45kts.

TROPICAL STORM 02W
14-23 MAR 2004

Fix Time Intensity for 02W
Intensity (kts)

## Super Typhoon (STY) 03W (Sudal)

First Poor : 0600Z 28 Mar 04
First Fair : 0000Z 02 Apr 04
First TCFA : 0300Z 02 Apr 04
First Warning : 0000Z 04 Apr 04
Last Warning : 1800Z 15 Apr 04, Extra-tropical
Max Intensity : 130 kts, gusts to 160 kts
Landfall : None
Total Warnings : 48

## Remarks:

1) Super Typhoon (STY) 03W formed approximately 100 nm east-southeast of Chuuk under the influnce of a low to mid-level ridge centered to the north. As the developing cyclone became more organized, it began to track westward along the southern periphery of the steering ridge. The cyclone exhibited an erratic stairstep track pattern from the 05 to 09 Apr as the strength and western extent of the steering ridge fluctuated. Additionally, the cyclone continued to intensify in an environment of weak vertical wind shear and good poleward outflow. The cyclone began to track northwestward along the southwestern periphery of the steering ridge on 08 Apr and then around 0000 z 09 Apr the 110 kt cyclone passed 25 nm to the south of Yap atoll. After passing Yap, STY 03W continued to intensify reaching a maximum intensity of 130 kts on 10 Apr when concentric eyewalls were noted in microwave imagery. This intensity was maintained for 12 hours as the cyclone approached the subtropical ridge axis. As the system crested the axis of the sub-tropical ridge it began to track northeastward and interact with the mid-latitude westerlies and the baroclinic zone south and east of Japan. STY 03W began to undergo extratropical transition and weaken on 15 Apr due to increased vertical wind shear, decreased outflow, and cooler sea surface temperatures. The cyclone also began to accelerate northeastward and passed within 10 nm of Iwo Jima between 0600 Z and 1200 Z on 15 Apr. Subsequently, the cyclone became extra-tropical and the final warning was issued at 1800 Z on 15 Apr.
2) STY 03W passed 25 nm to the south of Yap atoll on 09 Apr, causing significant damage to agriculture and to $90 \%$ of the buildings on the island. Additionally, one fatality, one injury, and 1,500 homeless were reported. The cyclone also passed within 10 nm of Iwo Jima, Japan, but no damages were reported.

## SUPER TYPHOON 03W (SUDAL)

02-15 APR 2004

Fix Time Intensity for 03W
Intensity (kts)

## Super Typhoon (STY) 04W (Nida)

First Poor : 0000Z 12 May 04
First Fair : 0600Z 13 May 04
First TCFA : 1200Z 13 May 04
First Warning : 1200Z 13 May 04
Last Warning : 0600Z 21 May 04, Extra-tropical
Max Intensity : 140 kts, gusts to 170 kts
Landfall : None
Total Warnings : 32

## Remarks:

1) Super Typhoon (STY) 04 W formed as a tropical depression approximately 95 nm west northwest of Palau. The cyclone quickly intensified to 50 kts within 12 hours and reached typhoon strength by 14 May at 1200 Z . Between 15 May at 1200 Z and 16 May at 0600 Z , a second rapid intensification phase occurred as the intensity increased from 90 kts to 140 kts due to enhanced poleward outflow caused by an upper level trough situated to the north and sustained equatorial outflow. STY 04W remained at super typhoon strength as it tracked along the east coast of the Philippines and until 18 May at 1200 Z when a gradual decrease in intensity began as the cyclone passed poleward of the ridge axis and encountered increased vertical wind shear. By 20 May at 1800Z, an approaching shortwave trough in the mid-latitude westerlies weakened the subtropical ridge and the cyclone began extratropical transition. The cyclone accelerated to a maximum of 44 kts by 21 May at 0000 Z and completed transition to an extratropical low at 0600 Z . STY 04 W followed a climotological recurvature track starting near Palau and around the western periphery of the sub-tropical steering ridge becoming extra-tropical east of Japan.
2) Reports from the Phillipines indicate crop and infrastructure damage was estimated at $\$ 1.3$ million, including 700 destroyed homes and 31 casualties or missing persons reported. Nearly 11,000 people were displaced from their homes, and $\mathbf{1 5 , 0 0 0}$ others were stranded as ferry services between Luzon and the central islands were suspended.

Figure 1-04W-3. 172249Z May 2004 Goes-9 Visible Imagery of STY 04W (NIDA), revealing a symmetrical eye off the east coast of Luzon with a peak intensity of 130 kts .

Figure 1-04W-4. $181113 Z$ May 2004 TRMM Multi-Sensor satellite images of STY 04W (NIDA), reveals a ragged eye off the east coast of Luzon with small areas of dry air are invading the western side of the system. The outer bands on the west side are also beginning to interact with Northern Luzon. Systems peak intensity is $125 k$ ks.

SUPER TYPHOON 04W (NIDA)
12-21 MAY 2004

Fix Time Intensity for 04W

Tropical Depression (TD) 05W

First Poor: 1500Z 13 May 04
First Fair : 0600Z 14 May 04
First TCFA : 0600Z 14 May 04
First Warning : 1200Z 15 May 04
Last Warning : 0600Z 17 May 04, Dissipated over water
Max Intensity : 35 kts, gusts to 50 Kts
Landfall : None
Total Warnings : 8
Remarks:

1) Tropical Storm (TS) 05W, developed in the South China Sea approximately 400 nm east of Vietnam and initially tracked westward at 5 to 7 kts along the southern periphery of the mid-level subtropical ridge. A mid-latitude trough tracking eastward to the north created a weakness in the subtropical ridge allowing TS 05 W to recurve poleward and track northeastward. Subsequently, the cyclone entered an environment of high vertical wind shear and the deep convection decoupled from the low level circulation center east of Nha Trang, Vietnam. The exposed low level circulation center moved northeastward and dissipated after 96 hours.
2) No damage reports were received for this cyclone.

Figure 1-05W-1. 142302Z May 2004 SSM/I Multi-Sensor satellite images of TD 05W, reveals a partially exposed Low-level circulation center approximately 185 nm from the southern Vietnam coast with a peak intensity of $\mathbf{2 5 k t s}$.

## TROPICAL STORM 05W

Fix Time Intensity for 05W

## Typhoon (TY) 06W (Omais)

First Poor : 0600Z 14 May 04
First Fair : 0000Z 15 May 04
First TCFA : 2130Z 15 May 04
First Warning : 0000Z 16 May 04
Last Warning : 0600Z 22 May 04, Extra-tropical
Max Intensity : 60 kts, gusts to 75 kts
Landfall : No
Total Warnings : 26
Remarks:

1) Tropical Storm (TS) 06 W developed as a tropical disturbance southwest of Chuuk and within 48 hours, the first warning was issued. The cyclone tracked westward along the southern periphery of the subtropical ridge and then after 18 hours began to move more west-northwestward towards Yap. After passing approximately 50 nm southwest of Yap with sustained wind speeds of 60 kts , TS 06 W continued west-northwestward along the southwestern periphery of the subtropical ridge and reached maximum intensity of $\mathbf{6 0}$ kts at 0000 z on 19 May. Approximately 18 hours later the cyclone began to recurve poleward and slowly weaken. Subsequently, TS 06 W rapidly weakened as it encountered the midlatitude westerly flow.
2) No damage reports were received for this cyclone.

First Fair : 0600Z 04 Jun 04
First TCFA : 1430Z 04 Jun 04
First Warning : 1800Z 04 Jun 04
Last Warning : 0600Z 11 Jun 04, Extra-tropical
Max Intensity : 100 kts, gusts to 120 kts
Landfall: 70 nm SSW Kyoto, near Gobo, Japan (approx. 0900Z on 11 Jun, after the final warning)

Total Warnings : 27
Remarks:

1) Typhoon (TY) 07W was initially detected as a tropical disturbance near Cantanduanes Island, Philippines. JTWC tracked this disturbance as it moved westward over southern Luzon and dissipated. Post analysis indicates that another cyclone subsequently formed over the South China Sea west of Luzon in a region of very weak steering flow. This weak steering environment persisted until about 1200 Z on 05 Jun after which the cyclone intensified to tropical storm intensity and began to move northeast. TY 07W reached typhoon intensity at 1800 Z on 07 Jun just prior to exiting the South China Sea. The cyclone began extratropical transition around 0000 Z on 09 Jun , east of Taiwan, and began to rapidly weaken as it tracked northeastward. TY 07 W crested the ridge axis and forward motion of the system increased. The last warning was issued at 0600 Z on 11 Jun as the cyclone had fully transitioned to an extra-tropical low prior to crossing Japan.
2) No damage reports were received for this cyclone.

Figure 1-07W-1. 080505Z June 2004 MODIS true-color image of TY 07W (Conson), located 70 nm northwest of the Philippines with an intensity of 75 knots.

Figure 1-07W-2. $090625 Z$ June 2004 Goes-9 visible image of TY 07W (Conson), reveals a small pinhole eye approximately 85 nm to the east of the Taiwan coast with a peak intensity of 90kts.

## TYPHOON 07W (CONSON)

## 04-11 JUN 2004

Fix Time Intensity for 07W
Intensity (kts)

Typhoon (TY) 08W (Chanthu)

First Poor : 0600Z 05 Jun 04
First Fair : 1300Z 05 Jun 04
First TCFA : 2000Z 08 Jun 04
First Warning : 0000Z 09 Jun 04
Last Warning : 0600Z 13 Jun 04, Dissipated over land
Max Intensity: 75 kts, gusts to 90 kts
Landfall : Que Nhon, Vietnam
Total Warnings : 18
Remarks:

1) Typhoon (TY) 08 W initially formed as a tropical disturbance on 05 Jun, approximately 260 nm southeast of Yap. The cyclone was slow to develop and remained a tropical disturbance for nearly three days. The first warning was issued on 08 Jun at 1200 Z as the system tracked towards the central Philippine Islands near Leyte Gulf. Over the next 18 hours the cyclone weakened as it tracked across the Philippines into the South China Sea, but was able to slowly reintensify to 45 kts after entering the South China Sea. Although the system had entered a more favorable environment of low vertical wind shear and warmer sea surface temperatures, slow intensification was noted due to outflow impinement caused by the inflow of upper level winds by the equatorward outflow of TY 07W located between Taiwan and Okinawa. By 1200Z on 11 Jun the cyclone began to infensify more rapidly as the outflow impingement associated with continued TY 07W lessened. This changed allowed TY 08 W to reach typhoon strength on 12 Jun as it continued to track westward along the southern periphery of the mid level steering ridge. TY 08W made landfall approximately nine hours later in central Vietnam near Que Nhon with a max intensity of 75 kts . The system continued to track inland and dissipated as a tropical cyclone over land near 0600 Z on 13 Jun.
2) No damage reports were received for this cyclone.

Figure 1-08W-1. 082212 Z June 2004 SSm/I Mulit-Sensor images of TS 08W (Chanthu), reveals a Lowlevel circulation center embedded in a large area of deep cnvctn just about to enter the eastern side of the Phillipine Islands with an intensity of 40kts.

## TYPHOON 08W (CHANTHU) <br> 05-13 JUN 2004

Fix Time Intensity for 08W
Intensity (kts)

## Typhoon (TY) 09W (Dianmu)

First Poor : 0600Z 11 Jun 04
First Fair : 0600Z 12 Jun 04
First TCFA : N/A
First Warning : 0600Z 13 Jun 04
Last Warning : 1800Z 21 Jun 04, Extra-tropical
Max Intensity : 155 kts, gusts to 190 kts
Landfall : Muroto, Japan
Total Warnings : 36
Remarks:

1) Super Typhoon (STY) 09 W formed as a tropical disturbance on 11 Jun, approximately 220 nm south-southeast of Yap. The cyclone rapidly developed into a tropical depression and initially tracked slowly north for 24 hours along the periphery of the low to mid level steering ridge located to the northeast. Subsequently, the cyclone began moving more poleward in response to the weakening and eastward movement of the ridge caused by a deepening mid-latitude trough. During this poleward movement an upper level low located northeast of STY 09W provided good poleward and eastward outflow. Along with these poleward outflow channels, a cross equatorial outflow channel increased. These factors allowed rapid deepening to occur and within 72 hours of the first warning, the cyclone was classified as a Super Typhoon with maximum intensity of 155 kts . The system maintained Super Typhoon intensity for approximately 42 hours. After the system crested the ridge axis and approached Japan it began to interact with a short wave trough approaching from the west causing the cyclone to weaken. The intensity of the cyclone continued to decrease before making landfall over Shikoku. The cyclone then became embedded in the baroclinic zone and began to move northeastward across Japan out into the Sea of Japan where it rapidly became extra-tropical. The final warning was issued at 1800 Z on 21 Jun just prior to making landfall a second time over the southern tip of Hokkaido.
2) Three people were killed and two went missing in Japan. Thousands of homes and businesses lost power, domestic flights were cancelled and the oil companies stopped shipping fuel from the refineries located along the western coast of Japan as the system tracked across Shikoku into central Japan.

Figure 1-09W-1. 180825Z June 2004 Goes-9 visible imagery of TY 09W (Dianmu), reveals a well defined symmetrical eye approximately 410 nm to the south-southeast of Kadena AB with a peak intensity of 120kts.

Figure 1-09W-1. 18/1202Z June 2004 SSM/I Multi-Sensor satellite images of TY 09W (Dianmu), reveals a well defined eye in the IR and BD imagery and concentric eyewalls in the microwave imagery. At this time the system was approximately 400 nm to the south-southeast of Kadena AB with a peak intensity of 125kts.

Figure 1-08W-3. $200225 Z$ June 2004 MODIS true-color image of TY 08W (Dianmu), located 140 nm eastnortheast of Okinawa with an intensity of 75 knots.

TYPHOON 09W (DLANMU)
13-21 JUN 2004

Fix Time Intensity for 09W
Intensity (kts)

## Typhoon (TY) 10W (Mindulle)

First Poor : 0100Z 21 Jun 04
First Fair : 1300Z 22 Jun 04
First TCFA : 0000Z 23 Jun 04
First Warning : 0600Z 23 Jun 04
Last Warning : 0600Z 04 Jul 04, Extra-tropical
Max Intensity : 125 kts, gusts to 150 kts
Landfall : Taiwan
Total Warnings : 45
Remarks:

1) Typhoon (TY) 10 W formed as an area of multiple convective areas consolidated approximately 60 nm east of Guam. An area of persistant convection had initially formed approximately 180 nm south of Guam on 21 Jun, however, the convection weakened and reconsolidated approximately three degrees further north. After tracking across Saipan the cyclone strengthened into a tropical depression and then tracked west-northwest under the influence of a low to mid-level steering ridge north of the system. On 23 Jun the cyclone reached tropical storm intensity and began tracking toward the southwest. Strong equatorward outflow as well as temporary poleward outflow provided by an upper-level low north of the system allowed the cyclone to further intensify to 55 kts on 24 Jun. However, increasing vertical wind shear began weakening the cyclone early on 25 Jun. TY 10 W continued to weaken to 45 kts before turning more northwestward and intensifing again by 1200 Z on 25 Jun. A combination of a mid-level ridge to the southeast and a developing weakness in the subtropical ridge caused the cyclone to turn poleward towards Taiwan on 30 Jun. TY 10W made landfall along the northeast coast of Taiwan and tracked inland towards Taipei, weakened rapidly and exited the island on approximately 0600 Z on 02 Jul. The low level circulation center was very difficult to locate at this point, but the cyclone eventually turned poleward along the eastern coastline of China and became extra-tropical by 0600 Z 04 Jul , when the final warning was issued.
2) TY 10W killed 31 and left 11 missing in the Philippines while $\mathbf{6}$ deaths were reported in Taiwan. TY 10W destroyed $\$ 11.7$ million worth of crops and livestock and $\$ 7.94$ million in infrastructure in the Philippines, while Taiwan reported $\mathbf{\$ 1 5 . 6 5}$ million damage to crops and infrastructure.

Figure 1-10W-1. 282230 Z June 2004 SSM/I Multi-Sensor satellite images of TY 10W (Mindulle), reveals a well defined eye northeast-east of the northeast coast of Luzon. Microwave imagery reveals a nearly symmetrical eye with the western bands interacting with northern Luzon. Associated peak intensity was 125kts.

Figure 1-10W-2. 290220 Z June 2004 MODIS true-color image of TY 10 W (Mindulle), located off the northeast coast of the Philippines with an intensity of 125 knots.

Figure 1-10W-3. 290220 Z June 2004 MODIS true-color image depicting eye detail of TY 10W (Mindulle), located off the northeast coast of the Philippines with an intensity of 125 knots. Resolution of image is 250m.

Figure 1-10W-4. 290801 Z June 2004 Goes-9 visible satellite image of TY 10 W (Mindulle), revealing a well defined eye to the northeast of Luzon with a peak intensity of 125kts.

## TYPHOON 10W (MLNDULLE)

21 JUN-04 JUL 2004

Fix Time Intensity for 10W

Typhoon (TY) 11W (Tingting)

First Poor : 0600Z 24 Jun 04
First Fair : N/A
First TCFA : 0000Z 25 Jun 04
First Warning : 1200Z 25 Jun 04
Last Warning : 1800Z 03 Jul 04, Extra-tropical
Max Intensity : 80 kts
Landfall : No
Total Warnings : 34
Remarks:

1) Typhoon (TY) 11 W developed approximately 600 nm southeast of Guam in the monsoon trough. The cyclone initially intensified slowly as it tracked along the southwestern periphery of the subtropical ridge. The cyclone passed approximately 65 nm to the east of Saipan on 27 Jun around 2100 Z and Saipan reported maximum sustained winds of 47 kts with a peak gust of 67 kts as a result of this passage. After passing Saipan, TY 11W began to track north-northwestward in response to a passing shortwave trough and reached a maximum intensity of 80 kts as poleward outflow improved. TY 11W crested the subtropical ridge axis approximately 60 nm east of Iwo Jima and began to accelerate northeastward and weaken as it merged with the mid-latitude westerlies. The final warning was issued on 03 Jul at 1800 Z as the system completed extra-tropical transition.
2) Reports indicated that although TY 11W passed at a distance of over 180 nm to the east of Guam, record setting rainfall caused extensive flooding and mudslides damaging many structures to that island. Saipan reported 3 deaths and extensive crop damage.

Figure 1-11W-1. $282049 Z$ June 2004 SSM/I Multi-Sensor satellite image of TY 11W (Tingting), shows the system pattern of tightly curved band transitoning into a banding eye pattern with a peak intensity of 80kts.

Figure 1-11W-2. $290345 Z$ June 2004 MODIS true-color image of TY 11W (Tingting), located 370 nm north-northwest of Guam with an intensity of 80 knots.

## TYPHOON 11W (TINGTING)

## 25 JUN-04 JUL 2004

Fix Time Intensity for 11 W

Tropical Storm (TS) 12W (Kompasu)

First Poor : 0600Z 12 Jul 04
First Fair : 1930Z 12 Jul 04
First TCFA : 0200Z 13 Jul 04
First Warning: 0600Z 13 Jul 04
Last Warning : 1200Z 16 Jul 04, Dissipated over land
Max Intensity : 45 kts, gusts to 55 kts
Landfall : Hong Kong
Total Warnings : 14
Remarks:

1) Tropical Storm (TS) 12 W was initially began as a broad amorphous mass of convection located approximately 425 nm south-southwest of Iwo Jima on 10 Jul. This unorganized mass of convection was tracked moving west for 2 days before cyclonic turning could be detected. Subsequently, TS 12 W reached a maximum intensity of 45 knots on 14 Jul at 1800 Z and remained at this strength for 24 hours. By 16 Jul at 0600 Z , the cyclone weakened and began to track poleward as the subtropical steering ridge became situated to the northeast. The system made landfall over Hong Kong and quickly dissipated.
2) No damage reports were received for this system.

## TROPICAL STORM 12W (KOMPASU)

12-16 JUL 2004

Time Intensity for 12 W

Typhoon (TY) 13W (Namtheun)

First Poor : 0230Z 24 Jul 04
First Fair : 1130Z 24 Jul 04
First TCFA : 1400Z 24 Jul 04
First Warning : 0000Z 25 Jul 04
Last Warning: 0600Z 01 Aug 04, Extra-tropical
Max Intensity : 90 kts, gusts to 110 kts
Landfall : Japan
Total Warnings : 30
Remarks:

1) Typhoon (TY) 13 W was first detected as an area of heavy convection at about 390 nm northeast of Saipan on 23 Jul. The disturbance was upgraded to a Tropical Depression on 25 July and initially moved northwest along the southwest periphery of the subtropical ridge. During this northwest movement, the cyclone rapidly intensified ( $25 \mathrm{kts} / 6$ hours) at around 0600 Z on 26 Jul due to enhanced outflow provided by the TUTT to the northeast. TY 13W made landfall over Shikoku Island shortly after 0600 Z on 31 Jul. The cyclone subsequently began transition into an extra-tropical low as it entered the Sea of Japan at which time a final warning was issued.
2) Reports indicated 6 injuries in southern Japan and as many as 155 flights in Shikoku were grounded. Reports also indicate approximately 500 mm of rain fell within a 24 hour period over southern Japan.

TYPHOON 13W (NAMTHEUN)
24 JUL-01 AUG 2004

Fix Time Intensity for 13 W

Typhoon (TY) 14W (Meranti)

First Poor : 0600Z 31 Jul 04
First Fair : 2100Z 02 Aug 04
First TCFA : 0230Z 03 Aug 04
First Warning : 1800Z 03 Aug 04
Last Warning: 0600Z 08 Aug 04, Extra-tropical
Max Intensity : $\mathbf{9 0}$ kts gusts to $\mathbf{1 1 0}$ kts
Landfall : None
Total Warnings : 19
Remarks:

1) Typhoon (TY) 14W was first detected as a tropical disturbance approximately 255 nm south of Wake Island On 02 Aug. TY 14W developed into a Tropical Depression about 03 Aug while moving northward. The cyclone passed 24 nm of Wake Island and then intensified to a tropical storm about 8 hours after CPA. By 1200Z on 05 Aug,TY 14W had intensified to typhoon strength, and then shortly thereafter, rapidly intensified to $\mathbf{9 0}$ knots. The cyclone maintained maximum intensity for 18 hours before beginning to weaken in an environment of high vertical wind shear and cooler sea surface temperatures. By 0600 Z on 08 Aug, TY 14W began to transition into an extra-tropical system and the final warning was issued around the same period.
2) No damage reports were received for this cyclone.

Figure 1-WP14-1. 052221Z August 2004 SSM/I Goes-9 visible image of TY 14W (Meranti), approximately 593 NM north of Wake Island. At this time, the system had a slightly cloud filled eye with dry air beginning to invade the east side with a peak intensity of 90 knots.

Figure 1-WP14-2. 060325Z August 2004 Goes-9 visible image of TY 14W (Meranti), at this time the system was located far north of Wake Island with a peak intensity of $\mathbf{9 0}$ knots.

## TYPHOON 14W (MERANTI)

02-09 AUG 2004

Fix Time Intensity for 14W

Tropical Depression (TD) 15W (Malou)

First Poor : 0600Z 31 Jul 04
First Fair : 0600Z 02 Aug 04
First TCFA : 0230Z 03 Aug 04
First Warning : 0000Z 04 Aug 04
Last Warning : 0600Z 05 Aug 04, Extra-tropical
Max Intensity : $\mathbf{3 0}$ kts, gusts to 40 kts
Landfall : Near Ako, Japan, west of Kyoto
Total Warnings : 6
Remarks:

1) Tropical Depression (TD) 15W developed approximately 375 nautical miles eastsoutheast of Iwo Jima, Japan, in the southwestern quadrant of a low to mid level steering ridge centered to the northeast. The system tracked rapidly northwestward around the western periphery of the subtropical ridge axis and intensified slightly in an environment of weak vertical wind shear. TD 15W tracked up the Kii Channel, passing just east of Shikoku, and made landfall near Ako, Japan, within $\mathbf{2 4}$ hours of its development. The lowlevel circulation center became disorganized as the system tracked across Honshu, and did not re-develop as the system moved over the Sea of Japan as it encountered cooler sea surface temperatures and strong vertical wind shear associated with the mid-latitude westerlies. $\mathbf{3 6}$ hours after the first warning was issued, TD 15W had completed extratropical transition approximately 275 nm northwest of Tokyo, Japan.
2) Reports from Japan indicate significant rainfall totals associated with this system in southern Shikoku, however no damages or fatalities were cited.

Figure 1-WP15-1. 040625Z August 2004 Goes-9 visible image of TD 15W (Malou), reveals a very small llcc south of Honshu at an intensity of $\mathbf{3 0}$ knots.

Figure 1-WP15-2. 041154Z August 2004 SSM/I satellite image of TD 15W (Malou), at this time the systems llcc was off the east coast of Shikoku tracking north towards Honshu at an intensity of 30 knots.

## TROPICAL DEPRESSION 15W (MALOU)

02-05 AUG 2004

Fix Time Intensity for 15W

## Typhoon (TY) 16W (Rananim)

First Poor : 0600Z 05 Aug 04
First Fair : 1430Z 06 Aug 04
First TCFA : 2100Z 06 Aug 04
First Warning : 1800Z 07 Aug 04
Last Warning : 0000Z 13 Aug 04, Dissipated over land
Max Intensity : 90 kts, gusts to 110 kts
Landfall : Near Wenling, China in the Zhenjiang Province
Total Warnings : 22

## Remarks:

1) Typhoon (TY) 16 W formed approximately 540 nm south-southeast of Okinawa, Japan and was initially steered poleward along the northwestern periphery of the near equatorial ridge located south of the system. The cyclone continued poleward along the western periphery of the ridge for approximately 48 hours until the Tropical Upper Tropospheric Trough (TUTT) located between the near equatorial ridge and the subtropical ridge to the north weakened and retreated eastward. Once the TUTT retreated, the two ridges merged and the subtropical ridge became the primary steering mechanism. This shift in steering ridges caused TY 16W to shift to a northwestward track towards Taiwan and intensify. The system was slow to intensify initially as the inflow from an upper level low located in the southern point of the TUTT hampered development. As the TUTT receded eastward the upper level low provided a poleward outflow channel for TY 16W and it reached typhoon status. The poleward outflow channel weakened as the upper level low filled, however, the system maintained radial outflow and the system reached a maximum intensity of $\mathbf{9 0}$ kts approximately $\mathbf{1 8}$ hours before making landfall. After landfall the cyclone weakened due to dry air entrainment and limited outflow. The system made landfall shortly after 1200 Z on 12 Aug, approximately 200 nm south of Shanghai, China near Wenling and dissipated over land.
2) 415,000 people were evacuated from the east coast of China, 115 people were killed, 16 were listed as missing and 1800 others had been injured. Most of the fatalities was caused by collapsing buildings. More than forty-thousand buildings were destroyed and another 90,000 were damaged and over 677,500 acres of crops were damaged. Approximately 4 billion dollars in damage occurred. This was reported to be the worst typhoon to hit China since 1997.

Figure 1-WP16-1. 11/0506Z August 2004 AMSR-E satellite image of TY 16W (Rananim), at this time, the system was located approximately 200 nm southwest of Okinawa Japan with a rough eye diameter of 45 nm and a peak intensity of 80 knots.

Figure 1-WP16-2. $120808 Z$ August 2004 TRMM satellite image of TY 16W (Rananim), reveals a well defined eye approximately 37NM east of the eastern coast of China. At this time, the deep convection on the western side of the system began to decrease due to the land interaction with China. During this time the peak intensity was 90 knots.

Figure 1-16W-3. $120240 Z$ August 2004 MODIS true-color image of TY 16W (Rananim), approaching the east coast of China with an intensity of 90 knots.

## TYPHOON 16W (RANANIM)

## 07-13 AUG 2004

Fix Time Intensity for 16W
Intensity (kts)

First Poor : 0600Z 10 Aug 04
First Fair : 1700Z 10 Aug 04
First TCFA : N/A
First Warning : 1800Z 10 Aug 04
Last Warning : 0600Z 12 Aug 04, Dissipated over water
Max Intensity : 35 kts, gust to 45 kts
Landfall : None
Total Warnings : 7
Remarks:

1) Tropical Storm (TS) 17W formed approximately 665 nm northwest of Wake Island bordering the baroclinic zone. Enhanced infrared and microwave satellite imagery indicated that TS 17 W was subtropical in nature. The cyclone rapidly tracked northwest along the northern periphery of the subtropical ridge. TS 17 W achieved a maximum intensity of 35 kts as the system tracked in an environment of moderate vertical wind shear and cooler sea surface temperatures. The cyclone moved rapidly into a more unfavorable environment, entrained cold dry air and completed transition to an extratropical low 72 hours after the first warning was issued.
2) No damage reports were received for this cyclone.

Figure 1-WP17-1. 120949Z August 2004 SSM/I microwave satellite image of TS 17W (Malakas), reveals a partially exposed low-level circulation center tracking above 32N near the end of the systems life. At this time, the system had a peak intensity of 35 knots.

Figure 1-WP17-2. $112001 Z$ August 2004 Goes-9 visible satellite image of TS 17W (Malakas), at this time, the systems low-level circulation center remained fairly organized with the majority of the associated deep convection to the west of the systems center. Peak intensity at this time was 35 knots.

TROPICAL STORM 17W (MALAKAS)

## 10-13 AUG 2004

Fix Time Intensity for 17W

Typhoon (TY) 18W (Megi)

First Poor : 2200Z 11 Aug 04
First Fair : N/A
First TCFA : 2300Z 13 Aug 04
First Warning : 0000Z 14 Aug 04
Last Warning : 1200Z 19 Aug 04, Extra-tropical
Max Intensity : 65 kts, gusts to 80 kts
Landfall : None
Total Warnings : 23
Remarks:

1) Typhoon (TY) 18 W developed from an area of convection located 260 nm west of Guam. The low level circulation that initially developed was weak and difficult to track. Three relocations of the cyclone were made before the first warning was issued approximately 150 nm northwest of Guam. Over the next couple of days, TY 18 W tracked westnorthwest under the influence of a mid-level ridge located northeast. On 16 Aug, TY 18W strengthened into a tropical storm and turned more poleward in response to a weakness in the ridge. Around 1200Z on 17 Aug, the cyclone passed approximately 75 nm to the southwest of Okinawa and maximum winds reported by Kadena AB at passage was 52 kts. On 18 Aug, TY 18W entered the East China Sea, weakened to 65 kts, crested the axis of the steering ridge and began to track northeast. TY 18W then passed between Cheju Island and the South Korean peninsula, accelerated northeastward into the Sea of Japan where it began to interact with the midlatitude westerlies and transitioned into an extratropical low on 19 Aug.
2) TY 18W lashed southern Japan and southeastern South Korea, killing 13 people in 3 days. Most of the deaths in Japan came from floods and mudslides from heavy rains. Over 700 Japanese were evacuated from their homes, while 2,400 South Koreans were left homeless. Kunsan AB reported no damage, while Kadena AB evacuated 7 RC/KC-135s and $1 \mathbf{C - 1 3 0}$. No other damage to military installations was reported.

Figure 1-WP18-1. $180552 Z$ August 2004 TRMM satellite image of TY 18W (Megi), located approximately 245NM NW of Okinawa Japan. At this time, the inner eye wall began to collapse as the system started a weakening trend. Peak intensity at the time was 65 knots.

Figure 1-WP18-2. $180001 Z$ August 2004 Goes-9 visible image of TY 18W (Megi), at this time, the systems low-level circulation center was located approximately 280NM southwest of Kyushu. The visible satellite imagery reveals a ragged coud filled eye witha peak intensity of 65 knots.

## TYPHOON 18W (MEGI)

13-19 AUG 2004

Fix Time Intensity for 18 W

First Poor : N/A
First Fair : 0000Z 18 Aug 04
First TCFA : 1430Z 18 Aug 04
First Warning : 1800Z 18 Aug 04
Last Warning : 0600Z 31 Aug 04, Extra-tropical
Max Intensity : 155 kts, gusts to 190 kts
Landfall : Near City of Kushikino, Kyushu Japan
Near Hikari, Honshu Japan
Near Shizunai, Hokkaido Japan
Total Warnings : 51

## Remarks:

1) Super Typhoon (STY) 19W formed east of Kwajalein on 17 Aug and tracked westward under the influence of the low-mid level ridge located north and east of the area. STY 19W intensified steadily and the first warning was issued by 1800 Z on 18 Aug. The system intensified at a climatological rate and continued to track westward along the southern periphery of the ridge through 21 Aug. Dual outflow channels developed after 21 Aug and allowed the cyclone to intensify rapidly and reach a maximum intensity of 155 kts approximately 75 nm northwest of Guam. A passing longwave trough caused a shift of the track to the northwest and provided for continuation of enhanced outflow which allowed STY 19W to maintain super typhoon strength through 0600 Z on 26 Aug. The longwave trough then propagated eastward and caused the mid-level steering ridge to strengthen and shift the track of TY 19 W slowly westward for a couple of days. Another longwave trough subsequently moved off the east coast of China causing the track to shift poleward towards Kyushu on 29 Aug STY 19W made landfall near city of Kushikino on the southwest coast of Kyushu at approximately 0000 Z on 30 Aug when Aburatsu station, on the coast, measured winds at 108 kts . STY 19W began to accelerate northeastward across Kyushu and onto Honshu near Hikari. STY 19W crossed southwestern Honshu and entered the Sea of Japan where it began to transition into an extra-tropical low. STY 19W, then a tropical storm, skimmed the northern edge of Honshu before crossing into Hokkaido near Shizunai and the system became an extra-tropical low around 0600Z on 31 Aug.
2) Japan news sources confirmed 7 deaths and 5,900 people evacuated due to heavy flooding on Honshu.

First TCFA : 2200Z 15 Aug 04
First Warning : 1200Z 19 Aug 04
Last Warning : 1200Z 26 Aug 04, Dissipated over land
Max Intensity : 85 kts, gusts to 105 kts
Landfall : Hanjiang, China
Total Warnings : 29
Remarks:

1) Typhoon (TY) 20W initially formed as a tropical disturbance on 13 Aug, approximately 145 nm west of Pohnpei. The cyclone strengthened to 35 kts on 20 Aug as an upper level low, which was initially inhibiting intensification, moved away and then began enhancing outflow. The cyclone also changed track at this time and began moving more northwestward around the western periphery of the subtropical ridge located east of the Marianas Islands. TY 20W achieved typhoon strength on 22 Aug and remained at this intensity for approximately $\mathbf{3 6}$ hours. Once the system reached maximum intensity of $\mathbf{8 5}$ kts, it began to track westward under the influence of the subtropical ridge over western China. The system tracked just north of Taiwan on 25 Aug and made landfall into China at about 1200 Z on that day. Due to increased friction and lack of surface inflow, the cyclone rapidly weakened and dissipated by 26 Aug at 1200 Z .
2) Reports from Shanghai indicate damage was heavy with 8,270 houses destroyed and over 46,000 hectares of farmland ruined. The Fujian Water Resources Department reported that six reservoirs were badly damaged and 50 dams had been breached.
Additionally, 937,000 people were moved to safety while a neighboring province evacuated 249,000.

First TCFA : 2130Z 25 Aug 04
First Warning : 0600Z 26 Aug 04
Last Warning : 0000Z 28 Aug 04, Dissipated over water
Max Intensity : 30 kts, gusts to 40 kts
Landfall : None
Total Warnings : 9
Remarks:

1) Tropical Storm (TS) 21 W initially developed as a tropical disturbance approximately 650 nm east of Saipan on 24 Aug. The disturbance tracked slowly westward until 26 Aug when it was upgraded to a tropical depression. At 1800Z on 26 Aug the system achieved tropical storm strength. TS 21W only remained at tropical storm strength for 12 hours before weakening as it became under the influence of linear to confluent flow from the northeast associated with the outflow from TD 19W. A 270325Z Aug AMSU microwave satellite imagery indicated TS 21W had become fully exposed with the deep convection displaced to the west over Guam. TS 21W continued to track west-northwestward along the southern periphery of the steering ridge to the north and dissipated as a tropical cyclone over water.
2) No damage reports were received for this cyclone.

Figure 1-WP21-1. $262025 Z$ August 2004 SSM/I microwave image of TS 21W (No Name), at this time the systems low-level circulation center is partially exposed to the east of the associated deep convection. During this time the system was tracking westward toward Guam with a peak intensity at the time of 35 knots.

Figure 1-WP21-2. $270413 Z$ August 2004 Goes-9 visible image of TS 21W (No Name), at this time the system was located approximately 255 NM northeast of Guam with a peak intensity of 35 knots.

TROPICAL STORM 21W
26-28 AUG 2004

Fix Time Intensity for 21W

## Super Typhoon (STY) 22W (Songda)

First Poor : 0600Z 26 Aug 04
First Fair : 1100Z 26 Aug 04
First TCFA : 1130Z 27 Aug 04
First Warning : 1200Z 27 Aug 04
Last Warning : 1800Z 07 Sep 04, Extra-tropical
Max Intensity : 125 kts, gusts to 150 kts
Landfall : None
Total Warnings : 46
Remarks:

1) Typhoon (TY) 22W initially developed as a tropical disturbance east-northeast of Kwajalein. The cyclone tracked westward along the southern periphery of the subtropical ridge as it intensified at near a climatologtical rate. By 0600 Z on 28 Aug, the cyclone began to move west-northwestward towards Okinawa. 24 hours later the system intensified to typhoon strength and continued to track west-northwestward along the southern periphery of the subtropical steering ridge and reached maximum intensity of 125 kts at 1200 z on 04 Sep. Approximately 18 to 24 hours later the cyclone tracked over central Okinawa with maximum wind speeds of 115 kts . TY 22 W crested the ridge axis and shifted to a north-northeast track towards western Kyushu with a maximum intensity of 90 kts . After TY 22W entered the Sea of Japan it rapidly began to weaken due to a passing major shortwave trough. By 1800 Z on 07 Sep, the cyclone became embedded in the mid-latitude westerly flow as an extra-tropical low.
2) Reports from Japan indicate infrastructure damage, with tens of thousands left without electrical power, and more than 700 people injured, 24 dead and another 15 missing.

Figure 1-WP22-1. 010345Z September 2004 AMSR-E microwave image of STY 22W (Songda), reveals a very symmetrical system with the intense deep convection south of a small pinhole eye. At this time, the system was located approximately 325NM North of Guam with a peak intensity of 125 knots.

Figure 1-WP22-2. $312101 Z$ August 2004 Goes-9 visible satellite image of STY 22W (Songda), reveals a very symmetrical system with a small pinhole eye. At this time the peak intensity was 130 knots.

Figure 1-22W-3. 010040Z September 2004 MODIS true-color image of TY 22W (Songda), located approximately 320 nm north of Guam with an intensity of 125 knots.

Figure 1-WP22-4. 050216Z September 2004 TRMM microwave image of STY 22W (Songda), at this time, the system was located approximately 45NM southeast of Okinawa Japan. Imagery suggests a possible concentric eyewall pattern with the inner eyewall being well defined while the outer eyewall is broken on the southeastern side. Peak intensity at this time was 120 knots.

## SUPER TYPHOON 22W (SONGDA)

Fix Time Intensity for 22W

First Poor : N/A
First Fair : 0600Z 04 Sep 04
First TCFA : 1730Z 04 Sep 04
First Warning : 1800Z 04 Sep 04
Last Warning : 1800Z 07 Sep 04, Dissipated over water
Max Intensity : 60 kts, gusts to 75 kts
Landfall : N/A
Total Warnings : 13
Remarks:

1) Tropical Storm (TS) 23W was first identified as a tropical disturbance east of Saipan, and drifted northwestward as is consolidated in a weak steering environment. Due to the development of dual outflow channels, the cyclone intensified rapidly and was first warned on at 1800 Z on 04 September, as it tracked northwestward along the southwestern periphery of a subtropical ridge anchored northeast of the cyclone. The rapid intensification rate persisted for 18 hours due to the development of an eastern outflow channel enhanced by an upper level low to the northeast. As the cyclone tracked rapidly northwestward and the distance increased between the cyclone and the upper level low, the linkage weakened and the intensification rate slowed. TS 23W attained a maximum intensity of $\mathbf{6 0} \mathbf{~ k t}$ at 0000 Z on 06 September, and maintained that intensity for $\mathbf{3 0}$ hours.

The subtropical ridge that provided the steering flow weakened due to a passing midlatitude trough, receded eastward, and began to track poleward. TS 23W began to weaken as it encountered an environment of increased vertical wind shear and tracked over an abnormally large pool of cool sea surface temperatures that were the result of substantial upwelling and mixing caused by the passage of TY 19W and TY 22W. As TS 23W tracked northward into an increasingly unfavorable environment, strong northeasterly shear caused the low level circulation center to become decoupled from the deep convection. Additionally, outflow was suppressed by an upper level low located just east of the weakening cyclone. TS 24 W dissipated over water prior to making landfall in southern Japan.
2) No damage reports were received for this cyclone.

Figure 1-WP23-1. $052201 Z$ September 2004 SSM/I micorwave image of TS 23W (Sarika), reveals the low-level circulation center was partially exposed to the northeast of the associated deep convection. At this time, the system was located northwest of Guam with a peak intensity of 60 knots.

Figure 1-WP23-2. 060102 Z September 2004 Goes-9 visible satellite image of TS 23W (Sarika), reveals a very well organized low-level circulation center northwest of Guam with a peak intensity of 60 knots.

## TROPICAL STORM 23W (SARIKA)

04-07 SEP 2004

Fix Time Intensity for 23W

Tropcial Depression (TD) 24W (Haima)

First Poor : 0230Z 09 Sep 04
First Fair : 1730Z 10 Sep 04
First TCFA : 1900Z 11 Sep 04
First Warning : 1800Z 12 Sep 04
Last Warning : 1800Z 13Sep 04, Dissipated over land
Max Intensity : 35 kts, gusts to 45 kts
Landfall : South of Shanghai, China
Total Warnings : 5
Remarks:

1) Tropical Storm (TS) 24 W initially formed along the southwestern coast of Taiwan as a low that disengaged from a frontal system extending over the island. As the low pressure system crossed over central Taiwan it began exhibit tropical features. TS 24 W remained a weak system as it tracked poleward along the eastern coast of Taiwan and the first warning was issued at 1800 Z on 12 Sep when the system was approximately 100 nm northnortheast of Taiwan. As the subtropical steering ridge built westward, TS 24 W shifted to a northwestward track towards eastern China and made landfall approximately 200 nm south of Shanghai, China.
2) No damage reports were received for this cyclone.

Figure 1-WP24-1. $121112 Z$ September 2004 SSM/I microwave image of TS 24W (Haima), reveals a weak fully exposed low-level circulation center located north of Taiwan with a peak intensity of 30 knots.

## TROPICAL DEPRESSION 24W (HAIMA)

Fix Time Intensity for 24 W
Intensity (kts)

First Poor : 2100Z 18 Sep 04
First Fair : 1300Z 19 Sep 04
First TCFA : 2000Z 19 Sep 04
First Warning : 0000Z 20 Sep 04
Last Warning : 1800Z 29 Sep 04, Extra-tropical
Max Intensity : 125 kts, gusts to 150 kts
Landfall : None
Total Warnings : 40
Remarks:

1) Typhoon (TY) 25 W formed approximately 500 nm east of Guam, and initially tracked westward along the southern periphery of the subtropical ridge and passed 65 nm southsoutheast of Guam. As the cyclone moved south of Guam, it intensified at a less than climatological rate due to weak upper level diffluence. Around 22 Sep TY 25 W shifted to a more northwest track towards a weakness in the subtropical ridge. At the same time TY 25W reached typhoon strength due to enhanced outflow from an upper level low. 24 hours later, as the system continued to move northwestward along the southwestern periphery of the subtropical ridge, a poleward outflow channel became established with an upper level low located to the northeast that contributed to rapid intensification of TY 25 W and development of a small eye. By 24 Sep, the system reached maximum intensity of 125 kts and maintained that intensity for 24 hours. TY 25 W passed approximately 70 nm south of Okinawa and shifted to a westward track and became quasi-stationary in a break in the subtropical ridge for nearly 24 hours. Subsequently, a shortwave trough over eastern China moved eastward which caused the cyclone to track northeastward. As the system moved northeast it began to weaken due to vertical wind shear. TY 25 W made landfall on the southern tip of Kyushu at typhoon strength. The cyclone then continued to weaken as it became embedded into the baroclinic zone and moves across the Kanto Plain into the Sea of Japan. TY 25W then moved across northern Japan, transitioned into an extratropical system on 30 Sep and moved into the western Pacific.
2) Reports indicate 18 fatalities and several more missing in Japan, primarily as a result of widespread flooding and mudslides caused by torrential rain. Reports further indicated more than 350 airline flights were cancelled, and train and ferry services were interrupted.

Figure 1-WP25-1. $260905 Z$ September 2004 TRMM microwave image of TY 25W (Meari), reveals a pinhole eye located approximately 128 nm to the west of Okinawa Japan. At this time the system had a peak intensity of 90 knots.

Figure 1-WP25-2. $270702 Z$ September 2004 Goes-9 visible satellite image of TY 25W (Meari), reveals a well defined eye located approximately 130NM west of Okinawa Japan with a peak intensity of $\mathbf{1 0 5}$ knots.

Figure 1-WP25-3. $281713 Z$ September 2004 AMSR-E microwave image of TY 25W (Meari), reveals a very large eye with the deepest convection on the northwest side. At this time, the system was located approximately 152nm to the southwest of Sasebo Japan with a peak intensity of 70 knots

## TYPHOON 25W (MEARI)

## 20-29 SEP 2004

Fix Time Intensity for 25 W
Intensity (kts)

## First Poor : 0600Z 29 Sep 04

First Fair : 2330Z 01 Oct 04
First TCFA : 1830Z 03 Oct 04
First Warning : 0000Z 04 Oct 04
Last Warning : 1800Z 09 Oct 04, Extra-tropical
Max Intensity : 140 kts, gusts to 170 kts
Landfall : None
Total Warnings : 24
Remarks:

1) Super Typhoon (STY) 26 W formed approximately 100 nm west-northwest of Saipan and initially drifted westward in the tropical easterly flow, as it slowly organized. Starting around 1800 Z on 30 Sep, a series of passing shortwave troughs and ridges yielded a stairstep pattern for the cyclone track. The cyclone was first warned on at 0000Z on 04 Oct, when it was approximately 700 nm south-southeast of Okinawa, Japan. The initial steering environment was weak with the dominant flow provided by the mid-level anticyclone anchored to the northeast. The cyclone tracked northward for 36 hours toward a weakness in the steering ridge caused by a mid-latitude trough propagating eastward across the East China Sea. After the trough had passed the sub-tropical ridge to the east began to build westward, steering the cyclone westward again before a final turn poleward along the western extent of the ridge. STY 26 W rapidly intensified as it approached the ridge axis due to weak vertical wind shear, strong poleward outflow, and warm sea surface temperatures. The cyclone attained super typhoon intensity shortly after cresting the ridge axis at 1800 Z on 07 Oct. As STY 26W began interacting with the mid-latitude westerlies, dual outflow channels developed, allowing the cyclone to reach its maximum intensity of $\mathbf{1 4 0}$ kts. This intensity was maintained for $\mathbf{1 8}$ hours as the system tracked northeastward. The cyclone subsequently began to weaken due to interaction with the baroclinic zone, the mid-latitude westerlies, and cooler sea surface temperatures. At 0000 Z on 09 Oct, the cyclone began to undergo extra-tropical transition, while accelerating northeastward. The cyclone made landfall on the Izu Peninsula in Shizuoka Prefecture, Japan, shortly after 0600 Z on 09 Oct. Despite encountering the Japanese terrain, the system intensified during its extra-tropical transition as it tracked northeastward across the Kanto Plain along the leading edge of a deep trough that was propagating eastward across the Sea of Japan. The final warning was issued on STY 26W at 1800 Z on 09 Oct, approximately 330 nm northeast of Tokyo, Japan.
2) Flooding and mudslides associated with the landfall and subsequent passage of STY26W across the Kanto Plain were reported in Japanese newspapers. Transportation systems serving Tokyo and the surrounding area, including domestic and international flights and the "Shinkansen" bullet trains, were paralyzed due to the flooding and mudslides. Six people were reported dead, along with five missing.

Figure 1-WP26-1. 070500Z October 2004 AMSR-E microwave image of STY 26W (Ma-on), reveals a relatively small system with a very well defined eye located approximately 300nm to the southeast of Okinawa Japan with a peak intensity of 90 knots.

Figure 1-WP26-2. $082228 Z$ October 2004 SSM/I microwave image of STY 26W (Ma-on), reveals a ragged eye located approximately 315NM to the southwest of Tokyo Japan with a peak intensity of 135 knots. Shortly before this time, the system had just went through an eyewall replacement cycle.

Figure 1-WP26-3. 080405Z October 2004 AMSR-E microwave image of STY 26W (Ma-on), reveals a very tiny system with a well-defined eye located to the southeast of Okinawa Japan with a peak intensity of 140 knots.

Figure 1-WP26-4. $090125 Z$ October 2004 Goes-9 visible satellite image of STY 26W (Ma-on), at this time, the system had a ragged cloud filled eye located approximately 215NM to the southwest of Tokyo Japan with a peak intensity of $\mathbf{9 0}$ knots.

## SUPER TYPHOON 26W (MA-ON)

04-09 OCT 2004

Fix Time Intensity for 26W

First Poor : 0030Z 10 Oct 04
First Fair : 2200Z 11 Oct 04
First TCFA : 0000Z 12 Oct 04
First Warning : 1200Z 12 Oct 04
Last Warning : 1800Z 20 Oct 04, Extra-tropical
Max Intensity : 125 kts, gusts to 150 kts
Landfall : Shikoku, Japan
Total Warnings : 34
Remarks:

1) Typhoon (TY) 27W formed approximately 40 nm northwest of Pohnpei and initially moved northwest in response to a mid-level ridge centered to the northeast. The first warning was issued on 12 Oct at 1200 Z as the system began to develop and move more westward towards Guam while developing at a climatological rate. Subsequently, the cyclone passed appoximately 25 nm north of Guam with an intensity of 35 kts , then continued westward for 36 hours before a westward moving shortwave trough weakened the steering ridge and caused the cyclone to move more northward. Additionally, the passing trough enhanced the poleward outflow which allowed TY 27 W to attain maximum intensity of 125 kts . After passage of the shortwave trough, the cyclone began to move more northwestward and weaken slightly. A longwave trough moving west out of Asia caused TY 27W to recurve on 18 Oct after 0000 Z . As a result of this longwave trough, TY 27W passed approximately 10 nm east of Okinawa, Japan on 19 Oct at approximately 0600Z. Kadena AB reported maximum wind gusts of 63 kts during this passage. After passing Okinawa, the cyclone began to accelerate and weaken significantly before making landfall near the southeast corner of Shikoku, Japan and then making another landfall near Osaka, Japan. TY 27W transitioned rapidly into a baroclinic system as it tracked northeastward and completed extra-tropical transition within $\mathbf{2 4}$ hours.
2) Japan Times reported $\mathbf{8 0}$ confirmed fatalites caused by flash flooding and mudslides. Over 44,800 homes were reported damaged by winds and flooding with 480,000 people evacuated due to storm impacts on Shikoku and Honshu.

Figure 1-WP27-1. 122219Z October 2004 TRMM microwave image of TY 27W (Tokage), reveals the system was in the early stages of eye formation. At this time, the system was located approximately 55NM to the northwest of Guam with a peak intensity of 45 knots.

Figure 1-WP27-2. $180441 Z$ October 2004 AMSR-E multi-sensor satellite image of TY 27W (Tokage), reveals the system is in the process of losing its inner eyewall as the system undergoes an eyewall replacement cycle just south of Okinawa Japan. At this time, the outer eyewall remained very intense with the system having an peak intensity of 95 knots.

Figure 1-WP27-3. $190702 Z$ October 2004 Goes-9 visible image of TY 27W (Tokage), reveals a slightly cloud filled eye located approximately 15NM to the south of Okinawa Japan with a peak intensity of 75 knots.

## TYPHOON 27W (TOKAGE)

Fix Time Intensity for 27 W
Intensity (kts)

First Poor : 1730Z 12 Oct 04
First Fair : 0600Z 13 Oct 04
First TCFA : 1430Z 13 Oct 04
First Warning : 0000Z 14 Oct 04
Last Warning : 0000Z 26 Oct 04, Extra-tropical
Max Intensity : 110 kts, gusts to 135 kts
Landfall : None
Total Warnings : 49
Remarks:

1) Typhoon (TY) 28 W initially formed as a tropical depression, approximately 190 nm south-southeast of Eniwetok Island on 13 Oct at 1800Z. The first warning was issued six hours later, however, the cyclone was slow to intensify in the first 3 days as an upper level low situated to the west inhibited outflow. TY 28 W began tracking westward around the southern periphery of the subtropical steering ridge to the north. The cyclone remained on this track until 19 Oct at 1200Z when it began to track northwestward. TY 28W intensified at a less than climatological rate due to increased vertical wind shear. It reached maximum intensity on 22 Oct due to favorable equatorward outflow, but cooler sea surface temperatures began to weaken the cyclone after 23 OctZ. By 24 Oct at 1200Z, TY 28 W began tracking poleward toward a weakness in the ridge and continued to decrease in intensity. By 25 Oct at 1200Z, the cyclone merged with the midlatitude flow of a transient major shortwave trough, and became extra-tropical on 26 Oct at 0000 Z .
2) No damage reports were received for this cyclone.

Figure 1-WP28-1. 162012Z October 2004 SSM/I microwave image of TY 28W (Nock-Ten), at this time, the system had a well defined IIcc with banding eye characteristics. The most intense convection is associated with the large band to the west. During this time, the system was located approximately 265NM to the northeast of Chuuk with a peak intensity of 45 knots.

Figure 1-WP28-2. $190415 Z$ October 2004 TRMM microwave image of TY 28W (Nock-Ten), reveals an average size symmetric eye located approximately 305NM to the southeast of Guam with a peak intensity of 90 knots.

Figure 1-WP28-3. $191558 Z$ October 2004 AMSR-E microwave image of TY 28W (Nock-Ten), reveals a nearly symmetrical eye located approximately 220NM southeast of Guam with a peak intensity of 90 knots.

Figure 1-WP28-4. $230413 Z$ October 2004 Goes-9 visible satellite image of TY 28W (Nock-Ten), reveals a very well-defined eye with a peak intensity of 110 knots.

Figure 1-WP28-5. $231725 Z$ October 2004 Goes-9 Enhanced Infrared BD curve image of TY 28W (Nock-Ten), reveals a symmetrical eye with a very intense outer eyewall. At this time, the system was located approximately 400NM southeast of Taiwan with a peak intensity of 105 knots.

Figure 1-WP28-6. 240900Z October 2004 Composite radar image for TY 28W (Nock-Ten), reveals a pinhole eye located 170NM to the southeast of Taiwan with a peak intensity of 105 knots. Image produced by the Taiwan Central Weather Bureau,

TYPHOON 28W (NOCK-TEN)

Fix Time Intensity for 28W

First Poor : 1600Z 13 Nov 04
First Fair : N/A
First TCFA : 2000Z 13 Nov 04
First Warning : 0000Z 14 Nov 04
Last Warning : 0000Z 26 Nov 04, Dissipated over land
Max Intensity : 115 kts, gusts, to 140 kts
Landfall : 100 nm Southwest of Bangkok, Thailand
Total Warnings : 49
Remarks:

1) Typhoon (TY) 29 W initially formed approximately 300 nm southeast of the island Yap on 11 Nov. The cyclone initially tracked northwestward for $\mathbf{3 6}$ hours and then shifted to a more west-northwestward track around the southern periphery of the subtropical ridge. The cyclone intensified to tropical storm stength by 1200 Z on 14 Nov and remained on a west-northwestward track for approximately 24 hours before shifting to a northwest track towards the Philippines. TY 29W approached the Philippines, intensified to typhoon strength and then slowly began to track poleward in a weak steering environment. The cyclone reached maximum intensity of 115 kts just off the east coast of northern Philippines then became quasi-stationary in the weak steering area asssociated with a break in the subtropical ridge. On 18 Nov TY 29W began to track southwestward along the southeastern periphery of the western ridge. Once the cyclone entered the South China Sea it re-intensified back to typhoon strength after weakening to a tropical storm during passage through the Philippine island. TY 29W continued to track southwestward through the South China Sea into the Gulf of Thailand where it dissipated.
2) Assets associated with the week long exercise Talon Vision-05 were pulled out of Clark Air Base and some 70 US Marines were evacuated via a military aircraft to Okinawa. Nearly 3000 people were stranded as the ferry crossings between Bicol and the central islands of the Philippines were closed to vessels under 1000 tons.

## Statistics for JTWC on TY 29W

Figure 1-WP29-1. 172302Z November 2004 SSM/I microwave image of TY 29W (Muifa), reveals a well defined eye located approximately 125NM east of the Luzon shoreline with a peak intensity of 90 knots.

Figure 1-WP29-2. $192217 Z$ November 2004 SSM/I image of TY 29W (Muifa), reveals the system after crossing southern Luzon into the Tablas Strait. During this time, the system maintained a small ragged and cloud filled eye with a peak intensity of $\mathbf{7 0}$ knots.

TYPHOON 29W (MUIFA)

Fix Time Intensity for 29W
Intensity (kts)

First Poor : N/A
First Fair : 272200Z Nov 04
First TCFA : 280300Z Nov 04
First Warning : 281800Z Nov 04
Last Warning : 031800Z Dec 04, Extra-tropical
Max Intensity : 130 kts, gusts to 160 kts
Landfall : Casiguran, Luzon, Philippines
Total Warnings : 21
Remarks:

1) Super Typhoon (STY) 30 W formed about 380 nm east-southeast of Chuuk and initially moved westward at 16 kts for 18 hours after the first warning was issued. The cyclone center passed approximately 8 nm north of Yap causing maximum winds of 80 kts on that island. While in the Philippine Sea, the cyclone moved rapidly northwestward along the southwestern periphery of the subtropical ridge. Even though the speed of movement of the system was at times over 19 kts , the radial outflow remained well organized and STY 30 W reached super typhoon strength prior to making landfall on the island of Luzon near Casiguran, Philippines. The cyclone then crossed over Luzon within 6 hours, weakening to approximately 100 kts . STY 30W then entered the South China Sea where it began moving poleward and started to further weaken as it entered an environment of increased vertical wind shear caused by mid-latitude westerlies flow. The system shifted to a northeastward track on 03 Dec towards Taiwan due to the effect of a short wave trough that was moving eastward through China. Prior to making landfall on Taiwan STY 30W rapidly transformed to an extra-tropical cyclone as it became embedded into a baroclinc zone.
2) A total of $\mathbf{7 0}$ fatalities, $\mathbf{3 7}$ missing and 157 injuries were reported in the Philippines. Over $\mathbf{1 0 , 0 0 0}$ homes were destroyed and another 55,000 plus damaged. STY 30 W was the fourth tropical cyclone in a span of $\mathbf{2}$ weeks to hit the Philippines.

Figure 1-WP30-1. $282123 Z$ November 2004 TRMM image of STY 30W (Nanmadol), reveals the system in the initial stages of development located approximately 220NM west of Chuuk with a peak intensity of 30 knots.

Figure 1-WP30-2. $301635 Z$ November 2004 AMSR-E image of STY 30W (Nanmadol), reveals a very well organized system with a small pinhole eye located approximately 185NM north of Palau with a peak intensity of 90 knots.

Figure 1-WP30-3. $011717 Z$ December 2004 AMSR-E image of STY 30W (Nanmadol), reveals the systems outer bands beginning to interact with the Philippine coast while maintaining a small pinhole eye. At this time, the system had a peak intensity of $\mathbf{1 2 0}$ knots.

TYPHOON 30W (NANMADOL)
28 NOV 2004-03 DEC 2004

Fix Time Intensity for 30W
Intensity (kts)

First Poor : 0130Z 09 Dec 04
First Fair : 0600Z 09 Dec 04
First TCFA : 2200Z 09 Dec 04
First Warning : 0000Z 10 Dec 04
Last Warning : 1200Z 19 Dec 04, Extra-tropical
Max Intensity : 50 kts, gusts to 65 kts
Landfall : None
Total Warnings : 39
Remarks:

1) Tropical Storm (TS) 31W formed near the Dateline on 8 Dec and tracked westward along the southern periphery of the low to mid-level ridge centered to the north. The first warning was issued on 10 Dec as the cyclone approached Kwajalein Atoll. TS 31W passed approximately 10 nm south of Kwajalein Atoll near 1200 Z on 10 Dec, which reported maximum gusts of 53 kts . The cyclone attained maximum intensity of 50 kts and weakened slightly in a moderate wind shear environment while tracking westward through the Caroline Islands. A passing shortwave trough in the mid-latitude westerly flow in the Philippine Sea after 15 Dec. The shortwave trough subsequently passed north and out of the area leaving TS 31W nearly quasistationary on 17 Dec before an east moving longwave trough caused the cyclone to resume a poleward track. TS 31W briefly reintensified shortly before becoming embedded in the longwave trough and rapidly transitioning to an extra-tropical low on 19 Dec.
2) No damage reports were received for this system.

Figure 1-WP31-1. $110221 Z$ December 2004 37GHZ AMSR-E image of TS 31W (TALAS), reveals the system in the early stages of development. At this time, the low-level circulation was located approximately 285NM west of Kwajalein with a peak intensity of 45 knots.

Figure 1-WP31-2. $180935 Z$ December 2004 SSM/I image of TS 31W (TALAS), reveals a fully exposed low-level circulation center located to the southwest of the associated deep convection. At this time, the system was beginning its extratropical transition and had a peak intensity of 35 knots.

## TROPICAL STORM 31W (TALAS)

10-19 DEC 2004

Fix Time Intensity for 31 W
Intensity (kts)

First Poor : 1700Z 15 Dec 04
First Fair : 1930Z 16 Dec 04
First TCFA : 0300Z 17 Dec 04
First Warning : 1800Z 17 Dec 04
Last Warning : 0600Z 21 Dec 04, Extra-tropical
Max Intensity : 55 kts, gusts to 70 kts
Landfall : None
Total Warnings : 15
Remarks:

1) Tropical Storm (TS) 32 W formed in the monsoon trough southwest of Pohnpei around 15 Dec and was initially slow to consolidate and intensify as it drifted northwest before the first warning was issued on 17 Dec at 1800Z. A passing longwave trough provided more favorable outflow and shifted the track poleward after 18 Dec . TS 32W subsequently passed approximately 55 nm east of Saipan with an estimated intensity of 45 knots. Saipan reported maximum sustained winds of 18 kts during closest point of approach. After moving past Saipan, the cyclone began to accelerate and reached a maximum intensity of 55 kts before it became an extra-tropical cyclone.
2) No damage reports were received for this system.

Figure 1-WP32-1. $181041 Z$ December 2004 SSM/I Multi-sensor image of TS 32W (Noru), reveals a partially exposed low-level circulation center located approximately 285NM to the east of Guam with a peak intensity of 35 knots.

Figure 1-WP32-2. $190001 Z$ December 2004 Goes-9 visible image of TS 32W (Noru), at this time the system was located approximately 180NM east of Guam with a peak intensity of 35 knots.

Figure 1-WP32-3. $201858 Z$ December 2004 TRMM image of TS 32W (Noru), reveals a well organized low-level circulation center located to the northeast of the Mariana Islands with a peak intensity of 55 knots.

TROPICAL STORM 32W (NORU)
17-21 DEC 2004

Fix Time Intensity for 32 W
Intensity (kts)

First Poor : 0500Z 28 Apr 04
First Fair : 1800Z 01 May 04
First TCFA : 1300Z 04 May 04
First Warning : 0000Z 05 May 04
Last Warning : 0000Z 10 May 04, Dissipated over water
Max Intensity : 45 kts, gusts to 55 kts
Landfall : None
Total Warnings : 21
Remarks:

1) Tropical cyclone (TC) 01A developed from a tropical disturbance that had formed in the Bay of Bengal and tracked westward across Sri Lanka and the south India. The cyclone was first warned on in the Maldive Islands and initially remained quasi-stationary for the first thirty-six hours and then intensified slowly to a maximum intensity of 45 kts as it drifted northward. Vertical shear caused the low level circulation center to become exposed as the cyclone moved northwest along the southwestern periphery of the subtropical ridge after 0600 Z on 08 May. The cyclone became more disorganized as increased vertical wind shear resulted in rapid weakening 09 May. The final warning was issued on this cyclone at 0000 Z on 10 May, approximately 225 nm west of Bombay, India.
2) No damage reports were received for this cyclone.

Figure 1-IO01-1. 071346Z May 2004 SSM/I Multi-sensor imagery of TC 01A, reveals a exposed Low-level circulation to the southeast of the associated deep convection with a peak intensity of 45 kts .

TROPICAL CYCLONE 01A
05-10 MAY 2004

Fix Time Intensity for 01A

Tropical Cyclone (TC) 02B

First Poor: 2300Z 14 May 04
First Fair : 1800Z 15 May 04
First TCFA : 2200Z 16 May 04
First Warning : 1200Z 17 May 04
Last Warning : 120019 May 04, Dissipated over land
Max Intensity : 65 kts, gusts to 80 kts
Landfall : Sittwe, Myanmar
Total Warnings : 6
Remarks:

1) Tropical Cyclone (TC) 02B was detected as a tropical disturbance approximately 480 nm south of Calcutta, India on 14 May. The cyclone Tracked north for three days before moving west. The first warning was issued on 17 May during this westward movement. TC 02B tracked slowly in a weak steering environment and meandered in a cyclonic loop for approximatley 30 hours before turning northeastward, towards Myanmar and attaining typhoon intensity just prior to landfall. TC 02B made landfall near Sittwe, Myanmar at approximately 0600 Z on 19 May, and a final warning was issued at 1800 Z on 19 May.
2) Reports indicated one person missing and 7 boats capsized.

Figure 1-02B-1. 180342 Z May 2004 SSM/I Multi-sensor imagery of TC 02B, reveals a partially exposed Low-level circulation center to the northeast of the associated deep convection with a peak intensity of 50kts.

TROPICAL CYCLONE 02B
12-19 MAY 2004

Fix Time Intensity for 02B

First Poor : N/A
First Fair : 070030 Sep 04
First TCFA : 0200Z 01 Oct 04
First Warning : 1200Z 01 Oct 04
Last Warning : 0000Z 03 Oct 04, Dissipated over water
Max Intensity : 35 kts, gusts to 45 kts
Landfall : near Porbandar, India
Total Warnings : 4
Remarks:

1) Tropical cyclone (TC) 03A formed approximately 300 nm south of Karachi, Pakistan and intensified slowly over 18 hours as it tracked northeastward. A maximum intensity of 35 kts was attained on 02 Oct when a poleward outflow channel developed. The cyclone then weakened over the next 18 hours as it approached northwestern India. The final warning was issued at 0000 Z on 03 Oct. The cyclone became decoupled and upper-level circulation moving inland over India and the low-level circulation center remaining in the Arabian Sea. The remnants of TC 03A was monitored for days as it made a cyclonic loop overwater south of Karachi, then tracked southward and he next four days, and turned northward towards India. The remnants finally tracked over land near Mangrol, India on 10 Oct.
2) No damage reports were received for this cyclone.

Figure 1-IO03-1. 020950Z October 2004 TRMM multisensor imagery of TC 03A, visible and infrared imagery reveal a very well organized low-level circulation center while the microwave images suggest the system has a small pinhole eye. At this time, the system was located approximately 120NM south of Karachi, Pakistan with a peak intensity of 35 knots.

Figure 1-IO-2. 080900Z October 2004 AMSR-E microwave image of TC 03A, reveals the systems low-level circulation center was fully exposed with no associated convection. At this time, the system was located west of India in the Arabian Sea with a peak intensity of $\mathbf{2 5}$ knots.

## TROPICAL CYCLONE 03A

## 01 -03 OCT 2004

Fix Time Intensity for 03A

First Poor : N/A
First Fair : 1800Z 03 Nov 04
First TCFA : 0700Z 04 Nov 04
First Warning : 1200Z 04 Nov 04
Last Warning : 1800Z 07 Nov 04, Dissipated over water
Max Intensity : 40 kts, gusts to 50 kts
Landfall : None
Total Warnings : 13
Remarks:

1) Tropical cyclone (TC) 04A was initially detected as a tropical disturbance west of the Maldive Islands on 01 Nov. The cyclone initially moved poleward for several days around the western periphery of the subtropical ridge as it consolidated. Subsequently, it began tracking westward under the influence of the ridge which became established north of the cyclone. The cyclone then intensified to tropical storm intensity reaching maximum intensity of 40 kts before vertical wind shear and slightly drier air began to affect the system.
2) No damage reports were received for this cyclone.

Figure 1-IO04-1. $060700 Z$ November 2004 Meteo-5 visible image of TC 04A, reveals a fully exposed low-level circulation center located southwest of the associated deep convection. Peak intensity at this time was 40 knots.

Figure 1-IO04-2. 071230Z November 2004 Meteo-5 visible satellite image of TC 04A, reveals a fully exposed low-level circulation center located 345NM northeast of Cape Guardafui, Somalia with a peak intensity of $\mathbf{2 5}$ knots.

Figure 1-IO04-3. 070324Z November 2004 SSM/I microwave image of TC 04A, reveals a welldefined, fully exposed low-level circulation center with a peak intensity of 35 knots.

TROPICAL CYCLONE 04A
04-07 NOV 2004

Fix Time Intensity for 04A

Tropical Cyclone (TC) 05A
First Poor: N/A
First Fair : 1800Z 26 Nov 04
First TCFA : 0300Z 28 Nov 04
First Warning : 0600Z 28 Nov 04
Last Warning : 1800Z 03 Nov 04, Dissipated over water
Max Intensity : 65 kts, gusts to 80 kts
Landfall : None
Total Warnings : 14
Remarks:

1) Tropical cyclone (TC) 05A formed approximately 550 nm west-southwest of Colombo, Sri Lanka and initially intensified slowly due to the effects of vertical windshear. The cyclone subsequently attained a maximum intensity of 65 kts on 29 Nov, and maintained this intensity for 30 hours. During this time, a small eye was noted on TRMM imagery, but was never seen in multispectral imagery. TC 05A then started to weaken on 30 Nov as it entered an environment of dry, continental air and increased vertical wind shear. The remnants of TC 05A tracked over land roughly 18 hours after the final warning was issued near Ceel Huur, Somalia.
2) No damage reports were received for this cyclone.

Figure 1-IO05-1. $280400 Z$ November 2004 MET-5 visible image of TC 05A (AGNI), reveals a broad low-level circulation center located in the southern Arabian sea just north of the equator with a peak intensity of $\mathbf{2 5}$ knots.

Figure 1-IO05-2. 300915Z November 2004 37GHZ AMSR-E image of TC 05A (AGNI), reveals a well organized system with a small pinhole eye. At this time, the system had a peak intensity of 65 knots.

Figure 1-IO05-3. 030530Z December 2004 MET-5 visible image of TC 05A (AGNI), reveals the systems low-level circulation is becoming decoupled from the associated convection. At this time, the system was located approximately 180NM east of Somalia with a peak intensity of 40 knots.

## 2. SOUTH PACIFIC AND SOUTH INDIAN OCEAN TROPICAL CYCLONES

### 2.1 GENERAL

In accordance with CINCPACINST 3140.1 (series), Southern Hemisphere tropical cyclones are numbered sequentially from 01 July through 30 June to reflect the Southern Hemisphere tropical season.

For warning message delineation, the Southern Hemisphere Area of Responsibility (AOR) is divided into two basins: the South Indian (west of $135^{\circ}$ East longitude) and the South Pacific Ocean (east of $135^{\circ}$ East longitude). The suffixes "S" (South Indian Ocean) and " ${ }^{\text {P" (South Pacific Ocean) are appended to the tropical cyclone number to differentiate }}$ warnings for these basins. For this report, the Southern Hemisphere AOR is broken down into three sub-basins, reflecting primary cyclogenesis areas: South Indian (west of $105^{\circ}$ East longitude), Australia ( $105^{\circ}$ East longitude to $165^{\circ}$ East longitude), and South Pacific (east of $165^{\circ}$ East longitude).

### 2.2 SUMMARY

Table 2-1 lists the significant tropical cyclones during the 2004 season and can be compared to the climatological mean presented in Table 2-2. Table 2-3 compares this year's tropical cyclone activity in the Southern Hemisphere sub-basins to previous years and climatology. Composites of the tropical cyclone best tracks for the Southern Hemisphere appear following Table 2-3.

The criteria used in TABLE 2-2 are as follows:

1) If a tropical cyclone was first warned on during the last two days of a particular month and continued into the next month for longer than two days, then that system was attributed to the second month.
2) If a tropical cyclone was warned on prior to the last two days of a month, it was attributed to the first month, regardless of how long the system lasted.
3) If a tropical cyclone began on the last day of the month and ended on the first day of the next month, that system was attributed to the first month. However, if a tropical cyclone began on the last day of the month and continued into the next month for only two days, then it was attributed to the second month.

## Tropical Cyclone (TC) 01S (Abaimba)

First Poor : N/A
First Fair : 290400Z Sep 03
First TCFA : 290930Z Sep 03
First Warning : 291800Z Sep 03
Last Warning : 041800Z Oct 03, Dissipated over water
Max Intensity : 50 kts, gusts to 65 kts
Landfall : None
Total Warnings : 11
Remarks:

1) Tropical cyclone (TC) 01S formed approximately 600 nm west-northwest of Diego Garcia along the northern periphery of a mid-level steering ridge to the south of the system. After the initial warning, TC 01S tracked eastward toward Diego Garcia for 18 hours, and then began a gradual poleward cyclonic turn. TC 01S intensified at a less than climatological rate, achieving a maximum intensity of 50 kts at 0600 Z on 01 Sep and maintaining that intensity for $\mathbf{1 8}$ hours before weakening. A short reintensification period occurred as the system crested the ridge axis, followed by a slow weakening trend as the cyclone encountered higher vertical wind shear poleward of the ridge axis. TC 01S dissipated south of the ridge axis as a significant tropical cyclone over water approximately 475 nm west of Diego Garcia.
2) No damage reports were received for this cyclone.

Figure 2-01S-1. 010150Z October 2003 multi-sensor satellite images of TC 01S (Abaimba), the partially exposed low level circulation center is located 450 nm east of the deep convection, northeast of Diego Garcia, with a maximum intensity of 30 knots.

TROPICAL CYCLONE 01S (ABAIMBA)
29 SEP 03-04 OCT 03

Time Intensity for 01S
Intensity (kts)

First Poor : 1800Z 07 Nov 03
First Fair : 1330Z 08 Nov 03
First TCFA : 2200Z 08 Nov 03
First Warning : 0600Z 09 Nov 03
Last Warning : 1800Z 20 Nov 03, Dissipated over water
Max Intensity : 100 kts, gusts to 125 kts
Landfall : None
Total Warnings : 26

## Remarks:

1) TC 02S formed approximately 400 nm east-northeast of Diego Garcia. Initially detected as a tropical disturbance on 07 Nov, it reached warning criteria in less than 48 hours. The cyclone moved southwest, toward Diego Garcia until 11 Nov when it began heading poleward along the western periphery of the steering ridge passing 110 nm to the west of Diego Garcia. TC 02S intensified to a peak intensity of 100 kts on 13 Nov when it also began a clockwise looping track. While in this looping motion, the cyclone weakened to a Tropical Depression. On 16 Nov, TC 02S began to move westward and slowly reintensified to a maximum of 75 kts on 19 Nov . Subsequently the cyclone weakened whil continuing on it's westward track and dissipated 440 nm north of Mauritius.
2) No damage reports were received for this system.

Figure 2-02S-1. $190429 Z$ November 2003 multi-sensor satellite images of TC 02S (Beni), the small embedded eye is located east of the deep convection, 250 nm southwest of Diego Garcia, with a maximum intensity of 65 knots.

## TROPICAL CYCLONE 02S (BENI) <br> 09 NOV 03-20 NOV 03

Time Intensity for 02S
Intensity (kts)

Tropical Cyclone (TC) 03S (Cela)

First Poor : 0200Z 04 Dec 03
First Fair : 1800z 04 Dec 03
First TCFA : 2300Z 04 Dec 03
First Warning : 1800Z 05 Dec 03
Last Warning(s) : 0600Z 10 Dec 03 and 0600Z 21 Dec 03, Extra-tropical
Max Intensity : 65 kts, gust to $\mathbf{8 0}$ kts
Landfall : Approximately 90 nm SSE of the northern tip of Madagascar
Total Warnings : 32
Remarks:

1) Tropical Cyclone (TC) 03S formed approximately 480 nm west-southwest of Diego Garcia. The first warning was issued as the cyclone tracked westward, reaching a maximum intensity of 45 kts before making landfall on the northern tip of Madagascar. TC 03S then entered the Mozambique Channel and weakened to 25 kts and a final warning was issued on 10 Dec at 0600 Z . Subsequently, TC 03 S began to reintensify in a more favorable environment of the Mozambique Channel. TC 03S then zigzagged along the western coast of Madagascar under the influence of a series of mid-latitude troughs. The cyclone experienced two periods of maximum intensity reaching 65 kts twice while zigzagging in a general poleward path. On 20 Dec, TC 03S encountered vertical shear and unfavorable sea surface temperatures as it tracked south of 30 degrees and weakened rapidly. The final warning was issued on 21 Dec at 0600 Z as TC 03 S transitioned rapidly into an extratropical low and accelerated southeastwards to speeds in excess of 50 kts .
2) No damage reports were received for this system.

Figure 2-04S-1. 091148 Z December 2003 SSM/I image of TC 04S (Jana), the northeast quadrant of the eye was weakening, located north of the Cocos Islands, with a maximum intensity of $\mathbf{8 0}$ knots.

# TROPICAL CYCLONE 04S (JANA) <br> 07 DEC 03-12 DEC 03 

Time Intensity for 04S
Intensity (kts)

## Tropical Cyclone (TC) 05P (Debbie)

First Poor : 0600Z 17 Dec 03
First Fair : 1300Z 17 Dec 03
First TCFA : 0900Z 18 Dec 03
First Warning : 1800Z 18 Dec 03, Dissipated over land
Last Warning : 65 kts, gusts to 80 kts
Max Intensity : 0600Z 21 Dec 03
Landfall : Near Turner Point, Australia.
Total Warnings : 6
Remarks:

1) Tropical cyclone (TC) 05P formed in the Arafura Sea approximately 60 nm southeast of the coast of New Guinea on 17 Dec. TC 05P tracked slowly westward in a weak steering environment at tropical depression strength for approximately 36 hours. Early on 19 Dec, steering influences strengthened, allowing TC 05P to increase speed to the southwest along the periphery of a mid-level steering ridge centered to the southeast over Australia. The favorable environment of the northwestern quadrant of the steering ridge fostered a climotological increase in the intensity of TC 05P over the next 24 hours. TC 05P peaked at 65 kts intensity at approximately 0600 Z on 20 Dec just prior to making landfall at about 1200Z on 20 Dec near Turner Point, Australia. The cyclone continued to track westsouthwesterly inland along the western periphery of a steering ridge over Australia and dissipated.
2) No damage reports were received for this cyclone.

Time Intensity for 05P
Intensity (kts)

First Poor : 1800Z 24 Dec 03
First Fair : 0130Z 23 Dec 03
First TCFA : 0000Z 29 Dec 03
First Warning : 0600Z 29 Dec 03
Last Warning : 1200Z 04 Jan 04, Dissipated over water
Max Intensity : 55 kts gusts to 70 kts
Landfall : None
Total Warnings : 14
Remarks:

1) TC 06S developed east of Diego Garcia and moved westward along the northwestern periphery of a low-level steering ridge while slowly developing. The first warning was issued six days after the tropical disturbance was first detected. After the initial warning, TC 06S intensified at a climatological rate, achieving a maximum intensity of 65 knots at 1800Z on 31 Dec and maintained that intensity for approximately 24 hours before weakening. This cyclone passed roughly 35 nm east of Mauritius on 02 Jan at approximately 1500 Z and then began to slowly weaken as it entered a high vertical wind shear environment associated with the mid-latitude westerly flow. TC 06S dissipated as a significant tropical cyclone over water approximately 625 nm south-southeast of Mauritius.
2) No damage reports were received for this cyclone.

Tropical Cyclone (TC) 07P (Heta)

First Poor : 0600Z 26 Dec 03
First Fair : 1500Z 28 Dec 03
First TCFA : 1900Z 30 Dec 03
First Warning : 0000Z 01 Jan 04
Last Warning : 0600Z 08 Jan 04, Extra-tropical
Max Intensity : 140 kts, gusts to 170 kts
Landfall : No
Total Warnings : 26
Remarks:

1) TC 07P (Heta) was first detected about 350 nm Northwest of Suva, Fiji on 26 Dec and slowly intensified before the initial warning was issued on 01 Jan at 0000 Z . On 02 Jan, the cyclone began to move more poleward and began to rapidly intensify ( 55 kt increase over eighteen hours) due to the establishment of extensive dual outflow channels. TC 07P passed west of Samoa with a maximum intensity of 140 kts gusting to 170 kts with Pago Pago reporting maximum gusts of 65 kts during the closest point of approach. The cyclone continued to track southeast and accelerate with the eyewall passing within 43 nm of Niue causing extensive damage to that island. Following the Niue passage, TC 07P began moving south-southeastward and rapidly weakened as it interacted with the mid-latitude westerlies. The final warning was issued on 08 Jan at 0600 Z as TC 07P transitioned into an extra-tropical low.
2) Extensive damage and one death was reported for Samoa and Niue through news sources as well government reports (U.S., New Zealand, etc) and World Meteorological Organization publications for Samoa and Niue. Flooding, toppled power lines, damaged homes and flattened crops were reported with damages estimated at over $\$ 50$ Million.

Figure 2-07P-2. 060100Z January 2004 MODIS true-color image of TC 07 P (Heta), located 40 nm westnorthwest of the Niue Island with an intensity of $\mathbf{1 2 5}$ knots.

TROPICAL CYCLONE 07P (HETA)
29 DEC 2003-09 JAN 2004

Fix Time Intensity for 07P
Intensity (kts)

Tropical Cyclone (TC) 08S (Ken)

First Poor : NA
First Fair : NA
First TCFA : 1500Z 01 Jan 04
First Warning : 1800Z 01 Jan 04
Last Warning : 1200Z 06 Jan 04, Dissipated over water
Max Intensity : 35 kts, gusts to 45 kts
Landfall : None
Total Warnings : 18
Remarks:

1) Tropical cyclone (TC) 08 S formed over land near Yampi Sound, Australia on 01 Jan. Development of the circulation center over land hampered early efforts to determine the cyclone position. However, sufficient development had occurred to warrant a Tropical Cyclone Formation Alert (TCFA) by 1500Z on 01 Jan. Within three hours of the TCFA issuance the cyclone center had tracked westward over water and a first warning was issued at 1800 Z on 01 Jan. Despite the rapid initial development, moderate vertical wind shear hindered subsequent intensification of this cyclone and it never exceeded weak tropical storm strength. Subsequently, TC 08S dissipated over water and the final warning was issued at 1200 Z on 06 Jan .
2) No damage reports were received for this system.

Figure 2-08S-1. 030128Z January 2004 SSM/I Multi-Sensor satellite images of TC 08S (Ken), reveal that the systems low-level circulation center is partially exposed to the East of the associated deep convection with an intensity of 35kts.

## TROPICAL CYCLONE 08S (KEN)

01 JAN 04-06 JAN 04

Time Intensity for 08S
Intensity (kts)

## Tropical Cyclone (TC) 09S (Elita)

First Poor : 1000Z 25 Jan 04
First Fair : 1800Z 25 Jan 04
First TCFA : 1300Z 26 Jan 04
First Warning : 1800Z 26 Jan 04
Last Warning : 0000Z 29 Jan 04, Extra-tropical
Max Intensity : 65 kts, gusts to 80 kts
Landfall : West of Mahajanga, Madagascar, Mananjary, Madagascar and near Morondava, Madagascar.

Total Warnings : 15
Remarks:

1) Tropical cyclone (TC) 09S was first identified on the Significant Tropical Weather Advisory on 25 Jan at 1000 Z as an area of persistent convection in the Mozambique Channel, approximately 50 nm off the western shore of Madagascar. The first Tropical Cyclone Formation Alert (TCFA) was issued on 26 Jan at 1300Z followed by the first warning issued five hours later at 1800 Z on 26 Jan . The system was initially forecast to track southeastwards into central Madagascar. However, a mid-level ridge to the west moved the system equatorward and resulting in a "relocated" third warning issued on 27 Jan at 1200Z. TC 09S subsequently began to move southeast over Madagascar and ultimately crossed Madagascar three separate times. First landfall occurred around 28 Jan at 1500 Z at an intensity of 60 kts near Mahajanga, Madagascar and a final warning was issued on the system on 29 Jan at 0000 z . The remnants of TC 09 S then traversed the interior of Madagascar and entered the southwest Indian Ocean where it slowed in response to a weak steering environment. TC 09S then began to move on a westward track and reintensify resulting in the issuance of a second TCFA on 30 Jan at 2200 Z .

The system made a second landfall near Mananjary, Madagascar while moving toward the Mozambique Channel. The cyclone became quasi-stationary in a weak steering environment approximately 125 nm off of western Mozambique and on 02 Feb reached an intensity of 55 kts, and then reversed course back towards the Mozambique Channel. TC 09S made its third landfall near Morondava, Madagascar on 03 Feb at 0200Z with an intensity of 65 kts. The system moved across Madagascar in approximately one day, weakened and reentered the southwest Indian Ocean on 04 Feb at approximately 0200 Z . The system exited land near Mananjary, the same community that the cyclone made
landfall at almost four days earlier. TC 09S then accelerated rapidly southeastward, became fully exposed and second final warning was issued on 04 Feb at 1800 Z .
2) The multiple crossings of TC 09S brought significant damage to Madagascar. The first landfall of TC 09 S caused the deaths of two citizens, cut water and electricity resources, left $\mathbf{5 , 0 0 0}$ homeless and damaged $\mathbf{9 0}$ percent of the buildings in northwestern Mahajanga Province. The return of TC 09 S a second and third time caused the deaths of four more people and left $\mathbf{1 3 , 0 0 0}$ more people homeless.

Figure 2-09S-2. 280735Z January 2004 MODIS true-color image of TC 09S (Elita), located just off the coast of Madagascar, within the Mozambique Channel with an intensity of $\mathbf{6 0}$ knots.

Figure 2-09S-1. 021717Z February 2004 EIR BD curve image of TC 09S (Elita), reveals the systems overall convective coverage extending throughout most of the Mozambique channel with outer bands on the Northeast side reaching the Northern tip of Madagascar. Peak intensity at this time was 65kts.

TROPICAL CYCLONE 09S (ELITA)
27 JAN-05 FEB 2004

Fix Time Intensity for 09S

First Poor : 1800Z 24 Jan 04
First Fair : 1000Z 26 Jan 04
First TCFA : 0130Z 27 Jan 04
First Warning : 1200Z 27 Jan 04
Last Warning : 1800Z 06 Feb 04, Dissipated over water
Max Intensity : 125 kts, gusts to 150 kts
Landfall : No
Total Warnings : 21
Remarks:

1) Tropical cyclone (TC) 10S was initially detected as a tropical disturbance approximately $\mathbf{7 8 0} \mathrm{nm}$ east-northeast from the northern tip of Madagascar. After the first warning, TC 10S moved poleward for the next nine days reaching two periods of maximum intensity. TC 10S reached a first intensity maximum of 125 kts on 02 Feb at 0000 Z , weakened to 90 kts as the system experienced dry air entrainment and then reintensified to 115 kts two days later on 04 Feb at 0000 Z as the upper level outflow improved. TC 10S then tracked more rapidly poleward and encountered the mid-latitude westerlies which then caused the cyclone to rapidly weaken. The final warning was issued on 06 Feb at 1800 z as TC 10 S encountered high vertical shear conditions and cooler waters which produced an exposed low level circulation center and subsequent dissipation.
2) No damage reports were received for this system.

Figure 2-10S-2. 020900Z February 2004 MODIS true-color image of TC 10S (Frank), located in the South Indian Ocean with an intensity of 125 knots.

Figure 2-10S-1. 040600Z February 2004 Met-5 visible image of TC 10S (Frank), reveals a pinhole eye with small amounts of dry air invading the east side of the system. At this time, the peak intensity was 115kts.

TROPICAL CYCLONE 10S(FRANK)
26 JAN-07 FEB 2004

Fix Time Intensity for 10 S
Intensity (kts)

First Poor : 1800Z 27 Jan 04
First Fair : 0300Z 28 Jan 04
First TCFA : 0500Z 28 Jan 04
First Warning : 0000Z 29 Jan 04
Last Warning : 1800Z 01 Feb 04, Dissipated over water
Max Intensity : 45 kts, gusts to 55 kts
Landfall : None
Total Warnings : 9
Remarks:

1) Tropical cyclone (TC) 11S developed approximately 400 nm northwest of the Cocos Islands on 29 Jan. The cyclone slowly intensified and tracked southeastward under the influence of ridging to the northeast. On 30 Jan, TC 11S turned due south and passed approximately 70 nm west of the Cocos Islands with an intensity of 35 kts . TC 11S achieved a maximum intensity of 45 kts on 31 Jan which it maintained for approximately 24 hours as it continued to track poleward. Subsequently, the system entered an increased vertical wind shear regime and the upper level convection decoupled from the low level circulation center and then dissipated over water.
2) No known impacts.

Figure 2-11S-1. $302330 Z$ January 2004 Met-5 Enhanced Infrared BD image of TC 11S (Linda), at this time, the systems Low-level circulation was embedded in a large CDO and approximately 145 nm south of the Cocos Islands with a peak intensity of 45kts.

TROPICAL CYCLONE 11S (LINDA) 28 JAN-02 FEB 2004

Fix Time Intensity for 11 S

First Poor : 2000Z 09 Feb 04
First Fair : 1030Z 10 Feb 04
First TCFA : 1700Z 10 Feb 04
First Warning : 0000Z 12 Feb 04
Last Warning : 1200Z 12 Feb 04, Dissipated over land
Max Intensity : 35 kts, gusts to 45 kts
Landfall : North of Burketown, Queensland
Total Warnings : 2
Remarks:

1) Tropical Cyclone (TC) 12P was first detected in the Coral Sea on 09 Feb and remained at or below tropical depression strength as it tracked westward across the Cape York Peninsula and into the Gulf of Carpentaria, where it briefly intensified to minmal tropical storm strength. A first warning was issued on 12 Feb at 0000 Z . Just before 0700 Z on 12 Feb, the system made landfall a second time north of Burketown, Queensland and a final warning on the system was issued on 12 Feb at 1200Z. JTWC continued to monitor the remnants of TC 12P as it tracked southwestward across northern Australia. The remnants then moved back over water south of Denham Sound on 16 Feb around 1800Z and rapidly merged with a passing shortwave trough. One hundred eighty three (183) satellite fixes were produced during the TC 12P remnant passage across Australia.
2) No damage reports were received for this cyclone.

Figure 2-12P-1. 112213Z February 2004 Goes-9 BD image of TC 12P (Fritz), at this time, the systems Low-level circulation is embedded amongst the associated deep convection. The system is tracking through the Gulf of Carpentaria and into Central Austrailia with a peak intensity of 45kts.

Fix Time Intensity for 12P
Intensity (kts)

First Poor : 2200Z 20 Feb 04
First Fair : 0600Z 21 Feb 04
First TCFA : 2030Z 21 Feb 04
First Warning : 1800Z 22 Feb 04
Last Warning : 0600Z 29 Feb 04, Extra-tropical
Max Intensity : 105 kts, gusts to 130 kts
Landfall : Near Port Vila, Vanuatu
Total Warnings : 14
Remarks:

1) Tropical cyclone (TC) 13P formed approximately 300 nm northeast of Vanuatu along the northern periphery of a low to mid level ridge located south of the system. Prior to the first warning, TC 13P made a cyclonic loop as it slowly tracked in a weak steering environment and consolidated. On 22 Feb at 1800 Z a first warning was issued and the cyclone tracked northeastward along the steering ridge for the next $\mathbf{3 6}$ hours. As the steering ridge weakened the system began to move southward and remained on this course until becoming an extratropical cyclone. TC $13 P$ intensified at a rate in excess of climatology over the first 72 hours after the initial warning due to enhanced upper level outflow conditions. The system peaked at an intensity of 105 kts and passed near Vanuatu between 25 and 26 Feb. Subsequently, TC 13P transitioned into an extra-tropical system approximately 370 nm southeast of Auckland, New Zealand on 29 Feb.
2) Reports indicated that villages in outlying islands of Vanuatu sustained major damage, including the uprooting trees and significant communications outages. Many houses were reported destroyed and approximately 2,000 people were evacuated from coastal and low lying areas in Port Vila. Reports confirm one injury but no other casualties.

Figure 2-13P-1. 262134 Z February 2004 SSM/I Multi-Sensor imagery of TC 13P (IVY), reveals the northwest eye wall was beginning to weaken as the system tracked south. At this time, the system was approximately 175 nm to the east of New Caledonia.

Figure 2-13P-2. 270215Z February 2004 MODIS true-color image of TC 13P (Ivy), located 150 nm eastnortheast of New Caledonia with an intensity of $\mathbf{1 0 0}$ knots.

TROPICAL CYCLONE 13P (IVY)
22 FEB 04-29 FEB 04

Time Intensity for 13P

First Poor : N/A
First Fair : 2330Z 26 Feb 04
First TCFA : 0200Z 27 Feb 04
First Warning : 0600Z 27 Feb 04
Last Warning : 0000Z 02 Mar 04, Dissipated over land
Max Intensity : 110 kts, gusts to 130 kts
Landfall : Mardie, Australia
Total Warnings : 15
Remarks:

1) Tropical Cyclone (TC) 14S was first detected as a tropical disturbance just off the northern coast of Western Australia, northeast of Port Hedland on 26 Feb. The cyclone rapidly intensified as it tracked westward along the southern periphery of the subtropical ridge through 28 Feb. A passing mid-latitude trough weakened the steering ridge and shifted the track poleward while enhancing outflow allowing TC 14S to reach an intensity of 110 kts on 29 Feb at 1200 Z . Subsequently, TC 14S weakened slowly as it tracked southeast before making landfall near Mardie, Australia on 01 Mar. Intensity at landfall was estimated by satellite at 90 kts but Mardie station reported maximum winds of 60 kts with a central pressure of 968 mb . The system continued tracking over land and weakened rapidly and a final warning was issued by 0000 Z on 02 Mar. The low level circulation center was readily apparent as the system tracked inland over the Great Sandy Desert for 12 hours before dissipating completely.
2) No damage reports were received for this cyclone.

First TCFA : 0300Z 01 Mar 04
First Warning : 0600Z 01 Mar 04
Last Warning : 0600Z 02 Mar 04, Dissipated over land
Max Intensity : 30 kts, gusts to 40 kts
Landfall : Multiple Events: North of Numbulwar, Australia and near Forrest River, Australia

Total Warnings : 4
Remarks:

1) Tropical Cyclone (TC) 15P was first detected in the Gulf of Carpentaria on 29 Feb as a tropical disturbance with heavy convection displaced from the low level circulation. The cyclone developed and moved west passing over Groote Eylandt before making landfall as a 30 kt cyclone, north of Numbulwar. Remnants of this cyclone were tracked and monitored for 72 hours as it moved west over land then emerged in the Indian Ocean near Collier Bay. Once the cyclone emerged along the northwest coast, the intensity remained at or below 25 kts, below warning criteria.
2) Damage reports indicate the cyclone brought heavy rains and strong winds to the town of Alyangula, approximately 600 km ESE of Darwin. No casualties were reported.

Figure 2-15P-1. 011034Z March 2004 SSM/I color composite image of TC 15P (Evan), reveals the convection is decoupled from the Low-level circulation center prior to landfall with a peak intensity of 30kts.

TROPICAL CYCLONE 15P (EVAN)
01 MAR 04-02 MAR 04

Time Intensity for 15P
Intensity (kts)

First Poor : 1800Z 29 Feb 04
First Fair : 0400Z 01 Mar 04
First TCFA : 0830Z 02 Mar 04
First Warning : 1800Z 02 Mar 04
Last Warning : 1800Z 11 Mar 04, Dissipated over land
Max Intensity : 140 kts, gusts to 170 kts
Landfall : Just north of Morombe, Madagascar
Total Warnings : 20
Remarks:

1) Tropical cyclone (TC) 16S formed approximately 240 nm south of Diego Garcia on 29 Feb. Following the issuance of the first warning on 02 Mar the cyclone moved southwest towards Madagascar. TC 16S made landfall along the northeast coast of Madagascar near the city of Antalaha on 07 Mar at 0000 Z with maximum winds of 140 kts . After passing over Madagascar into the Mozambique Channel, TC 16S maintained an intensity of 65 kts and continued to track southwestward. At approximately 0006 Z on 09 Mar, TC 16S began to track southeastward across southern Madagascar. As the system tracked across southern Madagascar it steadily weakened and dissipated over land. The final warning was issued on 11 Mar at 1800 Z .
2) TC 16S was reported to be one of the worst tropical cyclones to hit Madagascar in the past decade and left widespread damage and destruction. Reports indicated that 25 people were killed and at least 100,000 left homeless. A ferry carrying 91 passengers and 21 crewmembers sank as it crossed from the Comoran Island of Anjouan to Mahajanga, Madagascar with only 2 survivors found.

Figure 2-16S-1. 060655Z March 2004 MODIS true-color image of TC 16S (Gafilo), located approximately 180 nm east of Madagascar with an intensity of $\mathbf{1 4 0}$ knots.

Figure 2-16S-2. 060655Z March 2004 MODIS true-color image of TC 16S (Gafilo) showing eye detail at 250m resolution. System located approximately 180 nm east of Madagascar with an intensity of $\mathbf{1 4 0}$ knots

Figure 2-16S-3. 06/0801Z March 2004 Color 37 TRMM image of TC 16S (Gafilo), at this time, the system had concentric eyewalls with a peak intensity of 140 kts .

Figure 2-16S-4. 061330Z March 2004 Met-5 visible image of TC 16S (Gafilo), reveals a well defined symmetrical eye approximately 110 nm from the northeast coast of Madagascar with a peak intensity of 145kts.

TROPICAL CYCLONE 16S (GAFLLO)
01-11 MAR 2004

Fix Time Intensity for 16 S

First Poor : 0930Z 07 Mar 04
First Fair : 0130Z 08 Mar 04
First TCFA : 0300Z 08 Mar 04
First Warning : 1200Z 08 Mar 04
Last Warning : 1200Z 13 Mar 04, Dissipated over water
Max Intensity : 65 kts, gusts to 80 kts
Landfall : None
Total Warnings : 11
Remarks:

1) Tropical Cyclone (TC) 17S was initially detected as a tropical disturbance approximately 455 nm west of Cocos on 07 Mar at 1200 Z . The cyclone initially tracked eastward for $\mathbf{2 4}$ hours and then made a small loop moving westward before turning poleward on 09 Mar. The first warning for TC 17S was issued on 08 Mar as the cyclone became organized and intensified to 30 kts . TC 17S was slow to intensify until it turned poleward and began to track along the northwest periphery of the low to mid level steering ridge. On 10 Mar , TC 17 S reached maximum intensity of 65 kts and maintained that intensity for 42 hours before weakening. Subsequently, the cyclone continued to track poleward along the western periphery of the steering ridge and by 1200 Z on 12 Mar increasing vertical shear began to decouple the low level circulation center from the convection and the cyclone began to rapidly weaken.
2) No damage reports were received for this cyclone.

Figure 2-17S-1. 101530 Z March 2004 SSm/I Multi-sensor imagery of TC 17S (Nicky-Helma), at this time, the systems Low-level circulation center is decoupling from the deep convection with a peak intensity of 65kts.

TROPICAL CYCLONE 17S (NICKY-HELMA)
08 MAR 04-13 MAR 04

Time Intensity for 17S
Intensity (kts)

First Poor : 2100Z 14 Mar 04
First Fair : 0200Z 15 Mar 04
First TCFA : 2030Z 15 Mar 04
First Warning : 0600Z 16 Mar 04
Last Warning : 1800Z 27 Mar 04, Dissipated over land
Max Intensity : 120 kts, gusts to 145 kts
Landfall : 85 nm ENE of Port Hedland, Australia
Total Warnings : 26 warnings
Remarks:

1) Tropical Cyclone (TC) 18S first developed as a 25 kt tropical disturbance in the Arafura Sea on 14 Mar. As a weak cyclone, TC 18S tracked across the northwestern corner of Melville and Bathurst Islands. Then entered the Timor Sea, while continuing to intensify. As the track turned southward after 0600 Z on 17 Mar, the intensity rapidly increased to 75 kts in response to increased outflow and a decrease in vertical wind shear. After 0600 Z On 18 Mar, the cyclone turned northwestward as the steering ridge built, and the intensification rate decreased to a slightly less than climatological rate. By 0600Z on 19 Mar, TC 18S again began to track west-southwestward and reached its maximum intensity of 120 kts at 1200 Z on 21 Mar as a passing shortwave trough enhanced poleward outflow. Another passing mid-latitude trough weakened the mid-latitude steering ridge causing TC 18S to turn poleward. TC 18S attained a second intensity peak of 115 kts at 1800Z on 26 Mar while in an environment of favorable vertical wind shear and enhanced poleward outflow.

Following this second maximum, the intensity of TC 18S began to steadily decrease as the cyclone approached the northwestern coast of Australia. TC 18S made landfall just after 0000 Z on 27 Mar, about 85 nm east-northeast of Port Hedland, Australia, with sustained winds of 115 kts. The weakening cyclone moved southward for $\mathbf{0 6}$ hours before turning southeast and dissipating over land.
2) No damage reports were received for this cyclone.

Figure 2-18S-1. 210825Z March 2004 Goes-9 visible image of TC 18S (Fay), reveals a irregular cloud filled eye approximately 170 nm to the north of Yampi Sound with a peak intensity of 115kts.

Figure 2-18S-2. 212221 Z March 2004 SSM/I Multi-Sensor Imagery of TC 18S (Fay), at this time, the microwave imagery reveals a very small pinhole eye while the Enhanced Infrared imagery reveals the llcc is embedded on the south side of the deep convection. The peak intensity at this time was 120 kts .

Figure 2-18S-3. 270220Z March 2004 MODIS true-color image of TC 18S (Fay), just after making landfall over Australia with an intensity of 115 knots.

TROPICAL CYCLONE 18S (FAY)
15-27 MAR 2004

Fix Time Intensity for 18 S
Intensity (kts)

Tropical Cyclone (TC) 19S (Grace)

First Poor : 1530Z 18 Mar 04
First Fair : 0600Z 19 Mar 04
First TCFA : N/A
First Warning : 1800Z 21 Mar 04
Last Warning : 1800Z 22 Mar 04, Dissipated over water
Max Intensity : 35 kts, gusts to 45 kts
Landfall : None
Total Warnings : 3
Remarks :

1) Tropical cyclone (TC) 19 P was first noted as a tropical disturbance off the east coast of Australia, near Cairns as multiple low level circulation centers. Consolidation and development of this cyclone was slow with the first warning being issued over $\mathbf{7 2}$ hours after being detected. After the initial warning, the low level center remained partially exposed throughout the short life cycle and the cyclone only barely attained tropical storm intensity.
2) Damage reports indicated several roads were flooded or destroyed by landslides caused by the heavy rains during the formative stage of the cyclone's track. No casualties were reported.

TROPICAL CYCLONE 19P (GRACE)

## 20-23 MAR 2004

Fix Time Intensity for 19P

First Poor : N/A
First Fair : 0130Z 21 Mar 04
First TCFA : 0530Z 23 Mar 04
First Warning : 1200Z 23 Mar 04
Last Warning : 0000Z 28 Mar 04, Dissipated over water
Max Intensity : 115 kts, gusts to 140 kts
Landfall : None
Total Warnings : 10
Remarks:

1) Tropical cyclone (TC) 20 S formed in the southeast Indian Ocean approximately 380 nm east of the Cocos Islands on 21 Mar. The disturbance initially tracked southsoutheastward before turning westward and intensifying to warning criteria on 23 Mar. Late on 24 Mar, a migratory shortwave trough allowed the cyclone to turn southwestward. The system's rate of intensification rapidly increased after it's southwest turn. Due to enhanced outflow associated with the migratory trough, the cyclone intensified at a rate of two T numbers in twenty-four hours. The system continued to track southwestward for thirty-six hours after the rapid intensification before encountering increased vertical wind shear associated with the mid-latitude westerlies which caused the cyclone to rapidly dissipate on 28 Mar.
2) No damage reports were received for this system.

Last Warning : 1200Z 24 Mar 04, Dissipated over water
Max Intensity : 25 kts, gusts to 35 kts
Landfall : None
Total Warnings : 3
Remarks:

1) Tropical cyclone (TC) 21 S formed approximately 500 nm off the northeast point of Madagascar. The system was initially identified on 21 Mar as a region of deep convection over a low level circulation center (LLCC) in a region of moderate vertical shear. The initial warning for the system was issued on 23 Mar at 1800Z. The first forecast called for TC 21S to remain weak and quasistationary. The system tracked slowly in a general westward direction and never exceeded 25 kts in strength. Only two more warnings were issued with the final warning sent on $\mathbf{2 4}$ Mar at $\mathbf{1 2 0 0 z}$.
2) No damage reports were received for this system.

Fix Time Intensity for 21S

Tropical Cyclone (TC) 22P

First Poor : 0600Z 06 Apr 04
First Fair : 1030Z 07 Apr 04
First TCFA : 1500Z 07 Apr 04
First Warning : 1800Z 07 Apr 04
Last Warning : 0600 Z 09 Apr 04, Extra-tropical
Max Intensity : 35 kts, gusts to 45 kts
Landfall : Northeast of Lautoka, Fiji
Total Warnings : 5
Remarks:

1) Tropical cyclone (TC) 22P developed within the south Pacific convergence zone north of Fiji on 6 Apr around 0600 Z and quickly developed with the first warning issued on 07 Apr at 1800 Z as TC 22P tracked rapdily southeastward. TC 22P made landfall northeast of Lautoka, Fiji on 08 Apr around 0300 Z and tracked rapidly across the island. The final warning was issued on 09 Apr at 0600 Z as TC 22P merged with a mid-latitude trough and transitioned to an extra-tropical low.
2) Reports indicated at least $\mathbf{3}$ deaths and 9 missing persons in the districts north of Suva due to flooding caused by heavy rains.

Landfall : None
Total Warnings : 10
Remarks:

1) Tropical Cyclone (TC) 23 S was first detected as a tropical disturbance 725 nm east of Diego Garcia. It began moving west before looping clockwise to pass south of Diego Garcia on 10 May. After the Diego Garcia passage, the cyclone meandered southwestward while intensifying, and attained maximum intensity of 65 kts on 13 May at 1200Z. Subsequently, TC 23 S tracked poleward along the western periphery of the subtropical steering ridge until approximately 14 May at 0000 Z when it began to rapidly weaken due to increased vertical wind shear.
2) No damage reports were received for this cyclone.

Fix Time Intensity for 23 S

## 3. TROPICAL CYCLONE FIX DATA

### 3.1 2004 SEASON

Tables 3-1 to 3-3 list the number of tropical cyclone center "fixes", or locations, made using satellite (visible, infrared, and microwave), scatterometer, radar, and synoptic data. Fixes made by the DOD tropical cyclone reconnaissance network sites are included in the tables as well as those fixes received from other sources (e.g., Japanese Meteorological Agency, Australian Bureau of Meteorology, and U.S. National Weather Service National Environmental Satellite Data and Information Service). Table 3-4 lists the total fixes by basin.

## 4. SUMMARY OF FORECAST VERIFICATION

### 4.1 ANNUAL FORECAST VERIFICATION

Verification of warning positions and intensities at initial, 12-, 24-, 48-, and 72-hour forecast periods are made against the final best track. The (scalar) track forecast, along-track and cross-track errors (illustrated in Figure 4-1) were calculated for each verifying JTWC forecast. These data, in addition to a detailed summary for each tropical cyclone, are included as Chapter 4. This section summarizes verification data this year and contrasts it with annual verification statistics from previous years.

Figure 4-1. Definition of cross-track error (XTE), along-track error (ATE), and forecast track error (FTE). In this example, the forecast position is ahead of and to the right of the verifying best track position. Therefore, the XTE is positive (to the right of the best track) and the ATE is positive (ahead or faster than the best track). Adapted from Tsui and Miller, 1988.

### 4.1.1 WESTERN NORTH PACIFIC OCEAN

Table 4-1 includes mean track, along-track and cross-track errors from 1959, when JTWC was founded, until the present. Figure 4-2 shows mean track errors and a 5-year running mean of track errors at 24-, 48- and 72-hours since 1974.

Figure 4-7d. Mean track forecast error (nm) and 5-year running mean for 72 hours for Southern Hemisphere (Africa to 180 degrees) tropical cyclones from 1996-2004.

### 4.2 TESTING AND RESULTS

A comparison of selected techniques is included in Table 4-4 for all western North Pacific tropical cyclones, Table 4-5 for North Indian Ocean tropical cyclones, and Table 4-6 for Southern Hemisphere tropical cyclones.

For example, in Table 4-4 for the homogeneous comparison of the 12-hour mean forecast error between JTWC and CONW, 804 cases were available. The average forecast error at 12 hours was 42 nm for CONW and 43 nm for JTWC. The difference of 1 nm is shown in the lower right. Due to computational round-off, differences are not always exact.

| Table 4-4 Error Statistics for Selected Objective Techniques Western North Pacific |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
